assumed that people across the spectrum would enjoy watching *Home Affairs*, because the show represented the country's breadth of racial and ethnic identities. These women agreed that their life experiences as domestic workers were depicted in the drama through several characters; hence they felt close affinities with all of the characters except two Indian couples, with whom they were less familiar. Although Yolande shopped for household items in the Indian section of town, she felt her interactions and observations were limited to the formalities of business transactions.

By linking their everyday lives to the themes and characters of *Home Affairs*, these women demonstrated their engagement with the drama and its similarities to their own lives. Just as the poor female domestic workers in Cairo investigated in Abu-Lughod's (2005) study related television images to their own experiences, these black working-class women made close correlations between television characters, real life, and the increasing number of instances where national programming had registered their tastes and experiences – an inclusion that clearly resonated with their sense of belonging to the nation. While not actively involved in the fight for access to the political–public sphere, these women nevertheless illustrate the ideal of this concept through their resonance with representations that reflect multiculturalism and offer new ways of imagining such realities, even though such images are constructed within middle-class imaginings. Like women in the nineteenth century in the United States who “found circuitous routes” to “have a voice in some space open and accessible to all where they could be counted in the general interest,” these women celebrated the reflection and reproduction of their views and experiences as a gesture toward their inclusion in the public sphere (Ryan, 1992). Significantly, even as these women recognized the correspondence between television images and their lives as domestic workers, their interpretations were influenced by the ways in which they positioned themselves as being “middle class-identified,” even though their economic means made them part of the working class (Press & Cole, 2001). By subscribing to middle-class values and lifestyles in spite of their lack of financial capital, these women were able to discern similar tastes and experiences, which were chronicled by national culture industries. While they clearly disagreed with Cherise's decision to walk away from her newborn, they did not judge her coldly but offered her advice and assistance as she negotiated the difficulties of life and relationships. Furthermore, these women understood Thandeka's nurture of Cherise's baby as a step toward assuming responsibility for her own abandoned daughter. Their exuberant and interactive style of endorsing the values and characters in this show suggests the ways in which they established the show as proximate to their lives, even though it originated in a different social context and economic class; and they experienced this proximity as pleasurable – celebrating the value of their lives as domestic servants, mothers, friends, and women. However, not all women found the themes of the show to be proximate or preferred; this I will show in the next section, where I discuss the responses of a group of women who tended to negotiate *Home Affairs* meanings to a greater extent.

Familiarity and Ubiquity

Calling attention to what Iwabuchi describes as the situated notion of proximity or the ability of individuals to perceive similarities that are particular to their own experiences, background, and location rather than a quality inherent to the television artifact, the third group of viewers whom I interviewed recognized similarities both in nationally produced programs *and* in shows derived from the United States. Their impression that both types of programming were proximate to their experiences and realities works to define similarity in ways different from those of the other viewers – both black and white – who found correspondence *either* in imported *or* in nationally produced programming. By way of example, all 17 women in this group followed at least one South African soap opera, namely *Generations*, *Isidingo*, *Muvhango*, and/or *Sewende Laan*, while also claiming to be fans of one or more US soap operas such as *The Bold and the Beautiful* and *Days of Our Lives*. Occupying diverse categories of identity, these women were multilingual, multiethnic, multiracial; they ranged between 20 and 54 years of age, and some held graduate or bachelor degrees while others had only attended elementary or high school without completing their education and yet others described themselves as college students, stay-at-home wives, mothers, and/or working women.

Although these participants reportedly viewed both the imported and the South African programming, nevertheless they tended to favor one over the other and offered a variety of explanations and identifications to justify their pleasures. Some of these explanations accounted for the participants' sense of inclusion in the nation, while others intimated that they sought lifestyles and/or exercised values that did not mark them as national subjects. On the whole, these women adopted two stances toward programming: either they aligned themselves with the pleasures of the South African content, which they perceived to be realistic or comparable to their experiences or national knowledge; or they distanced themselves from the enjoyment of South African programming, which they found *too* realistic, even though they often-times described instances of recognition and engagement with the content.

As avid enthusiasts of South African soap operas, 11 women chronicled their fondness for South African content, even though they did watch imported programming to a greater or lesser extent. In their view, South African programming, and *Home Affairs* in particular, largely reflected their own everyday lives or experiences, was pedagogical in nature, and functioned to inspire citizens to imagine better lives; and this in spite of the fact that these same women were at times critical of the storylines and character development. While the notion of realism was central to these women's complicated pleasure in viewing *Home Affairs*, a second group of women, made up of six, observed a similar degree of realism in South African programming but experienced this "reality" as distasteful and off-putting. Confirming La Pastina and Straubhaar's (2005) findings that audiences respond to programming on multiple cultural levels in addition to geolinguistic similarity,

these women accounted for their enjoyment of imported programming as staging undemanding, universal themes, in contrast to the uniquely South African conditions that characterized national shows. In other words, the realism of national programming that resonated and inspired the first group worked to alienate the second group of women, even though they recognized their lives and the social problems of the country in the content.

Describing *Home Affairs* as realistic because “it’s kind of similar to our daily lives – most of the times [the things] that are happening there, [the things that] they portray, are like our real lives,” Nonne, a black middle-class college student from a neighboring country, represents both groups of mixed women, to judge by the ways in which the themes and characters ring true to her experience of being South African. Referring to Thandeka’s abandonment of Katleho, Nonne noted: “you can see that, nowadays, there are so many babies and also children. I think [women] do that [abandon their babies], yeah, they do that. It can be because of AIDS or it can be because of this kind of thing [career goals].” Liso, a young black middle-class college student from a neighboring country, also admitted to the realism of Cherise’s abandonment of her baby; she thought that “mothers do reject babies and can’t take care of them – I found that real.” Moreover, she pointed to Katleho’s hush-hush adoption by Nonhlanhla as a likely way to handle such a sensitive situation: “I found it true, the fact that Katleho maybe knew that Thandeka was her mother but that it wasn’t something that was spoken about in the open. It’s like sort of something that’s hidden. I found that real – it does happen like that.”

In addition to mostly perceiving the show to be a realistic and accurate reflection of the South African experience, these 11 women also experienced pleasure through the show’s moralistic and didactic tone. Thandiwe, a working-class Xhosa-speaking black woman in her thirties with an elementary school education, believed that *Home Affairs* modeled the possibilities of transformation so that viewers could see “what our lives *should* be.” For example Cherise, or any abused woman, “should have left her boyfriend”; and children should forgive their parents’ mistakes, just as Nonhlanhla teaches Katleho: “Your mother was doing that [abandoning you] but now you must forgive your mother.” Likewise, Gugu, a middle-class black woman in her forties who spoke Zulu and was also an international traveler with an undergraduate degree, mentioned that her favorite aspect of *Home Affairs* was its pedagogical disposition: “I could feel that if my son was faithfully watching it, he could have learned a lot from it, you know, especially from the angle of drugs, of women abused, all of those.” Mandisa, a middle-class Xhosa-speaking black woman in her thirties with a professional degree, maintained that the show taught viewers to differentiate between cause and effect:

It always happens with us, especially black[s], because we tend to have children and then we go and dump them with our Grand – our mothers – when [we] are pregnant, and then we want society and people to know that we don’t have any kids. So I think it’s got a message that was very educational.

Mandisa thus drew attention to the ways in which the realism of the show highlighted social practices and suggested the need for change.

Beyond comparing the show to their own lives, women found the themes of the show inspirational even if they also took a critical stance toward particular characters and storylines. Thandiwe emphasized that *Home Affairs* depicted life as it could/should be in South Africa: "I think it is saying 'this is what our lives should be,' Mam – because other people got no feelings for their wives. Sometimes the whites got no feelings for the blacks but some of the people have that feeling." Sharing Thandiwe's perspective for the potential for change in the country, Gugu highlighted the expanded possibilities for university students and young adults to cultivate relationships across race and class: "But now with these kids [Katleho and Katherine], both at university, outside the family environment, they could be attached [in spite of their different races] without any problem." Gugu thus found encouragement that young adults could forge more open relationships, as was illustrated on *Home Affairs*.

Even though women experienced pleasure in watching programming that was explicitly set in South African contexts, their engagement with shows such as *Home Affairs* was not a simple and straightforward identification. Instead, women were frequently critical of the ways in which realism was achieved, even as they identified at a general level with the authenticity of the show. Their capacity for distinguishing depictions of reality from their own daily realities suggests the anachronism of paternalistic and protectionist media policies that assess national viewers as infantile or deluded. As agents capable of evaluating critically messages of the media, viewers were thus able to conduct conversations about the reality of life in South Africa, as well as about general issues that they found compelling, from shows such as *Home Affairs*.

Demonstrating a critical approach to her enjoyment of *Home Affairs*, Amelia, a lower-middle-class 20-year-old "colored" woman, found Cherise's abandonment of her baby on the street implausible. She explained that "[Cherise] could have looked after the child. White women do not abandon their babies – they have other options." Demonstrating awareness of the racialized nature of economic capital, Amelia explained that white women typically possessed greater access to material resources than "colored" people like her. In a similar vein, Abigail, a working-class "colored" college student, connected the plot of *Home Affairs* with her own life, although she, too, was cognizant of the differences between the show and reality. Refusing to believe that a white woman like Cherise might suffer abuse, Abigail presupposed that such pain would more likely be inflicted on women who were "colored" or black, a matter-of-fact assumption she illustrated through her narration of a friend's experience of having her baby removed from her care because she was an unfit "colored" mother.

Although the second group of women also acknowledged the realistic mode of presentation in *Home Affairs*, they did not find pleasure in the aesthetics of this realistic national programming but instead gravitated toward imported programming that offered them entertainment rather than education. As a fan of *Bold* and *Days* rather than *Generations* or *Isidingo*, Olivia, a Tswana-speaking lower-middle-class

black college student attending college in a rural area of the country, explained that US soap operas “are clear – you understand – you don’t have to think, they’re just straightforward.” In contrast, she explained that South African soap operas blend programming objectives into “edutainment,” as was apparent in Cherise’s storyline, which required viewers to think: “when you see someone abandoning a child you obviously feel for that situation – you feel for the child. I think you come to a point where you feel, you know where you have that feeling that it is very wrong.”

Like Olivia, who had a sense of the educational impulse of South African shows, Mamello, a Sotho-speaking middle-class black college student, felt that South African shows were too realistic for her to enjoy: “even in the comedies [. . .] they deal with reality too much. You know, crime and the past, and they don’t move on – even the comedies! Comedy’s supposed to make you laugh, not depressed!” She found US shows more compelling on account of what she described as their lighthearted and inconsequential themes and tones.

Although the realism of *Home Affairs* was perceived by some women to be unattractive, these same women nonetheless identified closely with characters in the show. Mamello identified with the character of Thandeka, whose successful career in an NGO highlighted burgeoning career opportunities for black women in the country since the introduction of democracy. Acknowledging the benefits that her racial classification offered, as “it is even easier for them to hire me because I am black and a woman and I can go up very quickly and move to partner,” she also conceded that such policies were “pushing those women [black women chief executive officers (CEOs)] to go there and when they get there, they’re scared, they’re neglecting their families for work, they’re divorced.” Seeing her own experience mirrored in Thandeka, Mamello was nevertheless ambivalent about the effects of affirmative action policies, which reduced her pleasure in watching the show, as such moral lessons in the plot prevented her from relaxing during the show.

Farrah and Yafia, two Indian women who identified themselves as middle-class Muslim wives and mothers, typically watched very few South African productions and preferred imported programming, although both were engrossed in watching the episode of *Home Affairs* screened during the interview. Finding the show to be realistic and of current interest on account of its focus on interracial relationships – such as that between Thandeka, who is black, and Cherise’s baby, who is white – Farrah remarked on how the show corresponded with the changing values of the Muslim Indian community, which was grappling with the increasing problems of abandonment of babies and premarital sex – issues she felt had not been widespread when she was growing up. Significantly, despite acknowledging the social value of national programming, these two women did not elect to watch shows like *Home Affairs*, citing as reasons the need to screen its content from their young children (which they did by utilizing the tools of satellite television) and their preference for content related to the Muslim faith or community that was produced in other national contexts.

Although part of a group of women who preferred imported media content but nevertheless viewed a range of national programs, these women offered explanations

for their viewing practices and pleasures that implied that the life they imagined as ideal was not identical with national life as portrayed on television. While recognizing similarities in national television representations that felt true to the South African experience, these women did not desire the way of life depicted in national programming, and in some cases they held characters on the show in low moral regard. Significantly, while women in this group spanned a wide range of identities and had diverse ethnic, racial, age, and geographic origins, their economic affiliations tended to be middle class, and this similarity between them appeared to predict their preference for imported programming. Aspiring to a standard of living and social practices that emphasized beauty, optimism, and humor, much like the group of white women, these viewers veered away from social realist programming – or, in this case, shows produced by the nation. Calling attention to the notion of cultural competency to understand how black women viewers of *The Color Purple* negotiated the ideological meaning of the film, Bobo (2006) notes how viewers resonated with images of black women's histories and experiences, even though these images were produced within the institutional framework of white dominance. Similarly, the middle-class position of South African viewers shapes the interpretations they make of *Home Affairs*, particularly the fact that they prefer imported media images that promise more affluent lifestyles with fewer moral lessons. Using their class competencies, then, viewers interpret domestic shows as targeting women other than themselves, and thus they dismiss the relevance of national images of belonging.

Conclusion: Multiple Proximities and Nation-Building

In an attempt to expand the scope of South African audience research, this study has engaged with the intersections of race, ethnicity, gender, and class to examine how women respond to projects of multicultural nationalism through their reception of domestic and imported television programming. Although a diverse group of women were interviewed, several gaps remain still to be explored in future research. While this study focused on women's use of *Home Affairs* as one instance of local programming, men's reactions to such dramas remain unknown, even as a greater variety of social positions might suggest other uses of local programming, such as black upper-middle-class women's utilization of national programming and white working-class women's responses to shows such as *Home Affairs*. My analysis of interview data collected for this study shows that women viewers of *Home Affairs* recognized, to varying degrees, the ideologies of nation-building and multiculturalism that informed the show, since they maintained that this drama taught viewers how to improve the quality of their lives by aspiring to integration or unity in diversity. Depending on their partiality toward social realist programming, women reacted antagonistically, collaboratively, or critically to the goal of multicultural integration.

In their response to programming that they viewed as depressing and unrelated to their way of life or ambitions, white upper-middle-class women were inclined to reject the aesthetics and politics of social realism in dramas that invited them to participate in rebuilding the nation. Conscious of the manner in which *Home Affairs* constructed distinctive South African experiences in order to establish a sense of proximity, these viewers refused any corresponding identification. Rooted in their ample cultural and economic capital, viewers in this group identified more with programming stemming from anglophone geolinguistic regions that they deemed as relevant for their dreams and practices of upward mobility. Although these women made a cursory comparison of their lives to characters and themes in the show, the resulting similarities did not generate pleasure and often produced a rather unsympathetic response: viewers turned away from what they felt to be the grim realities of some South Africans' lives that triggered discomfort and anxiety. Confirming Iwabuchi's (2002) finding that cultural proximities, assumed to reside in local programming, do not necessarily create pleasure for national viewers, this group of white women preferred instead to watch imported programming that they identified as more contiguous with their social aspirations and as reinforcing their middle-class lifestyles and values. Yet, although white women in this study refused participation in the nation-building project and, by extension, refused integration in the multicultural nation, their oppositional stance is not necessarily any more progressive than black women's adoption of nation-building rhetoric. Presuming to be outside of the nation's project of uplift and not conceiving of themselves as targets of nation-building, these white women looked elsewhere for images of themselves. In other words, white women perceived themselves to be peripheral to the ideologies of integration and uplift, a perception anticipated by critics of multiculturalism who recognize the unlikely possibility that all subjects of the discourse of equality will be satisfied with their piece of the pie. On the basis of their cultural competencies, these women identified with other, more affluent national media industries and images of citizens, which depended less on social responsibility and more on ideologies of individualism and consumerism.

Although white women used imported programming for relaxation and entertainment, a group of older black working-class women preferred South African programming that they found inspirational for its portrayal of women in situations similar to their own, and, more often than not, they rendered images of citizens who valued racial integration, economic transformation, and ongoing reconciliation. As objects of nation-building rhetoric, these black women appreciated *Home Affairs* and aligned themselves with the moral imperative of creating unity; they did so by cheering on the characters' attempts to connect with each other and by wholeheartedly accepting the objective of integration, even though they had scarcely benefited from such national policies. Their sense that *Home Affairs* examined and exposed sensitive issues facing women, particularly women who were poor or who found themselves in relationships of abuse, underlines the ways in which television can create public spheres by promoting issues of general concern for discussion and debate. What is

also clear from their comments, however, is that ordinary citizens lack the power to call for social change, and that television mostly serves as an arena for opinion-formation and the exchange of information. As Press (1991) demonstrates, class is a key predictor of how audiences interpret media texts. To judge television content, working-class women thus appeared to use different criteria from those of upper-middle-class women, and they identified with nation-building ideologies that sought to legitimize citizens, regarding them as crucial to the progress of the nation. Moreover, the intersections of race and class informed audience decodings of television, as was evident in black working-class women's collective responses to the meanings of *Home Affairs*. These women's choice to view solely domestic programming appears to be contingent on the economic and cultural capital they possessed.

If the gratification described by these black women gestures toward an uncomplicated collaboration with official rhetoric, women who located proximity in both national and imported programming expressed a sense of critical identification with national objectives. One group of women exhibited a sense of cautious immediacy in relation to national programming, while a second group presented a more ambivalent relationship, out of deference for the ideas and lifestyles portrayed in imported shows. While both groups, composed of black, "colored," and Indian women, recognized *Home Affairs* as uniquely South African, the first group located a sense of hopefulness in the themes of the show while simultaneously identifying the ongoing legacies of apartheid, in which working-class black and "colored" women assumed the greatest burden of poverty and accumulated the fewest benefits from policies of affirmative action and multiculturalism.

Differences between the first group, women who critically accepted the pleasures of *Home Affairs*, and the second group, women who were more ambivalent in their identification, suggest the multiple points of proximity in women's relations with television programming and the complex modes of pleasure that are embedded in their social situations. Identifying several instances of similarity between their lives and the characters featured in *Home Affairs*, participants in the second group alternately described their lack of sympathy with the show and displayed a sense of recognition that the show somehow felt didactic rather than entertaining. Accordingly, while they watched national programming, these women were more hesitant about the pleasures of *Home Affairs*, a show they would not normally choose to watch.

Whereas racial affiliation appears to explain the interpretive strategies that both white upper-middle-class women and older working-class black women use to create meaning in television texts, the third group's responses cannot be consigned to a purely "racialized" analysis of the reception of domestic and international shows. Presenting a diverse range of identity positions, which encompassed race, ethnicity, age, geographic location, and religion, women in the third group did not respond according to any one homogenous category. However, as Bobo's theory of cultural competency illustrates, marginalized viewers may react either positively or negatively to media texts created within the dominant ideology. As citizens previously marginal-

ized in the apartheid state, black, “colored,” and Indian viewers have experienced a history of symbolic annihilation or the absence of media images of themselves on television. The recent proliferation of multicultural images on television provides women with images that they can either reject completely or negotiate more positively within the contexts of their histories and daily lives. On the basis of their cultural competencies related to class and race, women in this third group negotiated images that, for some, were more positive and reflective of their experiences, and for others held more negative associations and meanings, grounded in their backgrounds and social affiliations.

As women who live within the borders of South Africa and claim their rights as legal residents or citizens, the participants demonstrated multilayered identities through their varied attitudes toward nation-building rhetoric translated into television programming. Although the philosophy of multiculturalism promises the celebration and equality of all cultures, races, and genders, the accomplishment of South African unity in diversity has not yet materialized as a horizontal integration, but has instead been perceived by many women as one of fragmentation and even isolation. While multicultural nationalism has the potential to usher in an era of liberation (largely for the black majority), this form of nationalism perpetuates the historical legacy of national exclusivity – not only of white women, who feel estranged from any national identity, but also of women whose race and class intersect to construct identities that are not hailed by multicultural nationalism and who critically assess the ways in which the nation-state has delivered or not on the promise of inclusive citizenship.

NOTES

- 1 Serial shows on television in South Africa are referred to as “series” rather than as “seasons,” a typical convention in the US.
- 2 Commissioning Editors at the SABC, whom I interviewed in 2008, explained how, even though a show might not meet the Market Share expected by the commissioning channel, it might be recommissioned for a subsequent series if it met particular objectives, such as the language mandate criteria required by the channel.
- 3 Unlike the US system, the SABC initially commissions shows for an entire series, usually 13 episodes for a drama, and it seldom cancels episodes before the series has aired completely.
- 4 Market share details were not available for the 2009 season at the time of this writing.

- 5 The theoretical challenge to national unity posed by heterogeneous cultures is to develop "unity in diversity" or "forms of political integration that are sensitive to, compatible with, and accommodating of varieties of difference" (see McCarthy, 1999).
- 6 "Local" content quotas refer to programming that is produced in South Africa rather than alluding to programming that is produced in a local or regional area within or outside of the nation.
- 7 Charring refers to household work that is hired out to women by the day. Historically, black and "colored" women in South Africa have earned their wages by charring in white women's homes.
- 8 Social realism is a visual style adopted by SABC1 that "reflects [people's] lives and their concerns, that takes their views into consideration – not tabloid or sensational" (SABC, 2008, p. 17).
- 9 Pierre Bourdieu describes four types of capital that define individuals beyond their social class: economic capital that can be translated into money; cultural capital that stems from educational qualifications; social capital represented by group memberships and cultivated to secure profits; and symbolic capital, or the unstated prestige, honor, and attention that signal access to a network of resources (see Bourdieu, 2001).
- 10 While programming from the United States contains references to the national context, some authors argue that United States programming successfully crosses national boundaries because audiences have become familiar with its conventions and themes and do not perceive such programming to be foreign or unfamiliar.
- 11 *Generations* (1993–) is a long-running soap opera set in an advertising agency headed by Karabo, the only surviving member of the Moroka family. Surrounded by a group of women as her assistants, Karabo is challenged by powerful men, as well as by Anne de Villiers, an employee at the agency for control of Ezweni Communications. Created by Mfundu Vundla, it is the most watched soap opera in the country on SABC1; *Muvhango* (1998–) is a Venda-language soap opera set in a Johannesburg township and it centers on the conflicts between a family across the rural and urban divide; is broadcast on SABC2. *Isidingo* (1998–) airs on SABC3 and centers on the relationships between the Haines family, which owns On!TV, and the Matabane family from Horizon Deep, a mining town. The soap opera is written by head writer Greig Coetzee.
- 12 Ululating is a high-pitched sound, produced by the fast moving tongue and uvula.

A Framework for Audience Study of Transnational Television

Chua Beng Huat

ABSTRACT

In the past two decades, television in East Asia has become progressively integrated to constitute a regional cultural economy juxtaposed against the programs imported from the globally dominant US. In terms of popular reception, audience formation, and attendant social and political process, East Asian television programs have far greater regional impact than their US counterpart. Consequently East Asia television audience reception research has emerged in the past decade as a field that engages a new community of Asian media scholars. Drawing on this expanding field of research, the present chapter will attempt to develop the beginning of a conceptual framework that focuses on the reception of imported programs in different regional locations. Such a conceptual framework holds transnationality as the central problematic in a whole range of issues – such as the content transforming practice of dubbing, the generation of audience identification with foreign content and artistes, the politics of transnational fandom, and the possibility of a pan-East Asian identity. In addition to its heuristic value for other investigations of regional audience formations, this preliminary analysis, which has identified a small set of necessary components, invites further research to develop a more fully fleshed out framework for the analysis of transnational audience practices.

Introduction

As a consequence of satellite and cable technology, there has been a proliferation of television stations and channels in many urban locations around the world, and hence the quantity of global television programming time has exploded in the last three decades. Outside developed nations, the rapidly growing footprint of television has led stations to import programs from the global market rather than to engage in relatively more expensive in-house production. Television is thus a transnational industry – a situation exemplified by the dominance of the US as a major supplier of ready-made programs and formats to the rest of the world. The transnational character of media is indexed by ideologically laden concepts such as “cultural imperialism” and “cultural security”; the first refers to the presumed cultural influence an imported TV program might have on the culture of the importing locations, and dovetailing with this presumption; the second refers to the perceived need to preserve the local culture from such foreign cultural invasion or contamination. Beyond these imprecise and politically motivated concepts, which are always challenged whenever they are evoked, is the emergence of a transnational audience for TV products; namely, local audiences watching imported foreign TV programs, where the culture in which the audience is embedded is different from the culture of the location where the programs are produced.¹

A part of this global expansion of transnational flows of TV products consists in the emergence and consolidation of a loosely integrated East Asian television industry – Japan, Korea, People’s Republic of China (PRC), Taiwan, Hong Kong, and Singapore (Chua, 2004; Iwabuchi, 2002). Since the mid-1990s the organization, the formation, and the cultural and political impact of this regional transnational audience have been the focus of media scholars in East Asia. Using the regionally organized East Asian television industry as an illustrative instance and drawing on the empirical research of media analysts from the region, this chapter outlines a set of research topics for the investigation of the character and consequences of the transnational consumption of television serial dramas. By emphasizing intra-regional flows, this analysis veers away from the prevalent tendency to examine transnational media in terms of US dominance over the rest in media globalization – an enduring academic trend that has directed both empirical research and conceptual discussions of audiences. The relative “cultural” proximity that exists within the regional audience in East Asia, along with the cultural distance from the US, demands new ways of thinking about transnational audience studies.

East Asian Pop Culture

Since the early 1920s pop culture – pop music, movies, and street operas – in different Chinese languages – primarily Cantonese, Mandarin, and Minnan/Hokkien/

Taiwanese – has traveled throughout East Asian locations where ethnic Chinese (henceforth Huaren, 华人),² are numerically the absolute majority, namely the People's Republic of China (PRC), Hong Kong, Taiwan, and Singapore. In Singapore, which is geographically positioned in Southeast Asia, the ethnic Chinese represent an overwhelming majority – more than 70% – of the national population. This historically consolidated regional network of pop culture financing, production, distribution, and development of transnational Huaren audiences served readily as the foundational structure for the subsequent flows of television programs, once TV stations were established in quick succession in Taiwan, Hong Kong, and Singapore during the first half of the 1960s; PRC was by then closed off to the rest of the region.³ Pivotal in this history of regional pop culture is the Shaw Brothers enterprise. From the 1920s onwards, the company built a regional entertainment empire throughout, with the movie industry as the core business. Production was primarily based in Hong Kong, and the films were exhibited throughout the region in the company's own movie houses (Yung, 2008). In 1970s the Shaw Brothers established TVB, which swiftly became (and remains) one of the two dominant stations in Hong Kong. By the 1980s Shaw Brothers shut down the movie studios (Curtin, 2002), while maintaining the cinemas. Its TV programs, particularly serial dramas, were widely distributed throughout Huaren- dominant areas; for example, the internationally famous Hong Kong actor Chow Yun Fatt was first introduced to Singapore audiences on the small screen, in the very popular television drama *Men in the Net*, in the 1970s.

During the mid-1990s trendy Japanese dramas were added to this well-established television distribution network.⁴ The visual pleasure of watching these generic romance stories – of love gained and lost among urban young professionals, and with agonizing twists and turns – is derived from the beautiful men and women actors who represent the major and minor characters. The well-dressed and glamorous characters sport designer clothes, live in cosy small apartments, and eat in expensive – usually Western – restaurants in the high end sections of the city's entertainment districts; hence these programs epitomize the idea of “trendy.” Ota Toru (2004), a television program producer who works with Fuji TV, recalls that, when he first began producing these dramas during the bubble economy years of the 1980s, his aim was to eschew serious themes in favor of shows that emphasized instead fashion, setting, cast, and music, in order to target female viewers in their twenties. The regional popularity of these dramas, which attracted loyal audiences in East Asia, was largely accidental and circumstantial. Media liberalization in Taiwan, after the lifting of martial law in 1987, resulted in the sprouting of satellite channels, which then required inexpensive content to fill the radically expanded programming time. Taiwanese businessmen would travel to Japan and return with digital versatile disc (DVD) sets of Japanese dramas for illegal broadcasts. Meantime, the very porous and ineffectual ban on the import of Japanese cultural products to Korea – a ban that was in place since the end of the World War II, as a political response to Japanese colonization – was lifted in 1998.⁵ With the lifting of this ban, Japanese pop culture, including TV dramas, freely and openly flowed into Korea. The popular reception

given to Japanese programs in other parts of East Asia came as an unexpected surprise to Japanese producers, who had actually given little consideration to the likely export markets for their dramas.

By the end of the 1990s, just as Japanese trendy dramas were becoming part of the routine programming of TV stations in East Asia, the region was inundated with Korean pop culture. In 1995 the Korean government had taken a policy decision to make pop culture a new export industry (Shim, 2002; 2006, pp. 31–35). The almost immediate regional success of Korean TV dramas was largely due to the fact that they were much cheaper for the importers, namely about one quarter of the cost of Japanese dramas and one tenth of that of Hong Kong dramas (Shim, 2006, p. 13). Taiwanese TV stations were the first to import Korean dramas; they also acted as agents in re-exporting them to Hong Kong, PRC, and Singapore. The huge popularity of the very first drama to be broadcast in the PRC, in 1997 – *What Is Love All About* – caused such a sensation that PRC media writers dubbed the arrival of Korean pop culture, particularly TV dramas, as the “Korean wave” (Shim, 2006, pp. 28–31). In 1999, in Singapore, a new Mandarin language television station (Channel U)⁶ used Korean dramas as one of its primary vehicles to successfully carve out a significant audience base. The popularity of the Korean dramas pushed the established, government-owned dominant channel to compete for similar imports. The bidding war that resulted led to the merger of the two stations into a single corporation, MediaCorp, in 2004, an event that put an end to mutual financial cannibalization. Finally, in 2003 *Winter Sonata* was first broadcast in Japan on late-night satellite stations, but its popularity was such that it had three successive broadcasts within a two-year period (Mōri, 2008). Five thousand Japanese fans, largely middle-aged women, descended on the Tokyo airport in April 2004 to welcome to Japan the lead actor, Bae Yong Jun, whom they nicknamed *Yongsama* (“Prince Yong”).

There is no doubt that, by the end of the first decade of the twenty-first century, a loosely integrated regional television cultural economy has emerged in East Asia. As producers build the regional market into their business and creative plans, television programs from different regional locations travel across national and cultural boundaries routinely, albeit in unequal flows. Japan and Korea are primarily exporting countries, while Singapore and the PRC are largely locations for consumption of imported dramas. Taiwan and Hong Kong are exporters of Chinese-language dramas and importers of Japanese- and Korean-language ones. The unequal patterns in this regional flow are a consequence of market forces. Japanese and Korean dramas are dubbed and subtitled by their importers into Chinese languages, for distribution in the massive combined Huaren market of PRC, Taiwan, Hong Kong, and Singapore and in the global diaspora. On the other hand, the dubbing or subtitling of Chinese-language dramas into Korean or Japanese is, financially, a process much less viable – although not entirely impossible – than the Japanese dubbing of Korean dramas. Television dramas from different locations in East Asia are now an integral part of the daily programming of local stations in different contexts; for example, the Mandarin language channel in Singapore carries several hours of Korean, Japanese,

Hong Kong, and Taiwanese dramas daily. The formation of a transnational audience for television programs that circulate across national borders in East Asia has taken place in tandem with the development of this regional television industry.

TV Drama Audience

The generic and technological features of popular media products determine to some extent the methodological and substantive issues concerning audience consumption that become possible avenues for academic inquiry.⁷ The serial quality of a TV drama demands that an audience maintain viewing at regular intervals, usually once a day or once a week for one episode. In order for people to form a committed drama audience, they need to sacrifice many other activities, or at least displace them, so as to catch the new episode each week. Sometimes audience members have to make special arrangements to video-record an episode if they cannot avoid missing it. They may have to carve out time to catch up with, and watch, the missed episode before the next installment is screened in the scheduled program slot. These active forms of engagement with screen culture draw the audience into an intimate virtual relationship with the characters of their favorite dramas. Unlike the open-ended format of American TV dramas, which can run until their audience wears thin, East Asian dramas typically conclude after a number of episodes. Arguably, knowing that there is a conclusion may encourage an audience to be more committed to sustained and regular viewing over the length of the series; significantly, it is commonly observed that the concluding episode of a popular drama series tends to secure much higher audience rating than any intermediate episode. Together, the demand for sustained engagement and the ease of access, since these dramas are brought unto TV screens at home, make the act of watching television dramas one of the most intriguing and important popular practices in the realm of audience reception studies.⁸

Domesticating/Preserving the Foreign

In analyzing transnational audience, one should logically begin by examining the details of the actual viewing practices. If “recognition” is indeed central to viewing pleasure (Ang, 1985, p. 20), then it is necessary to examine how recognition is facilitated across linguistic, cultural, and national boundaries. This is usually done by either subtitling or dubbing or both. Analysis needs to pay attention to the mediation of subtitling/dubbing in the process of generating not only recognition and identification, but also difference and distancing from what is on the screen in transnational audience viewing practices.

As mentioned above, the flows of TV dramas within East Asia tend to run from Korea and Japan into the massive regional Huaren market, where the distribution of Korean and Japanese dramas is facilitated by dubbing into a Chinese language – Cantonese for Hong Kong and Mandarin for Taiwan, Singapore, and China.⁹ In dubbing, “visual synchrony” between the translated words and the lip’s movements on screen – that is, lip-sync – creates “the impression that the actors on screen are pronouncing the translated word” in order to generate the belief that one is viewing a “local” program; emphasis should be placed on the term, local.¹⁰ Constrained by this need to lip-sync, the translator must “move away from the source text to focus on the function of the text and on the viewer” (Varela, 2004, p. 35). Where expressions and contextual references of the source language have no equivalent in the target language, the translator/translation has an obligation to orient toward the cultural context of the target language and to change the source dialogue accordingly in order to “to provide the viewers what they are used to” rather than cater for the greater demands of professional written norms (Agost, 2004, pp. 68–69).¹¹ Elements of the culture of the target audience are thus introduced into the dubbed text. Therefore ideological dubbing is a process through which “a particular target culture for historical, social, and political or economic reasons, seeks to domesticate a foreign product and to make both the translator and the translation invisible” (Varela, 2004, p. 39).

In the case of East Asian TV dramas, dubbing adds to the domestication possibility / process, which is already facilitated by the relatively similar physiognomy, a shared ideographic Chinese script, a common Confucian worldview, and overlapping histories, both of conflicts and of diplomatic relations.¹² These factors – including “a sense of living in the shared time and common experience of a certain (post)modernity” (Iwabuchi, 2001a, p. 56) in contemporary times – constitute a multilayered “cultural proximity” that significantly accounts for the possibility of a regional East Asian television culture and industry.¹³ For example, the very popular Korean period drama series *Jewel in the Palace* (*Dae Jang Geum*, 大长今; henceforth *Dae*) chronicles the rise of a palace cook who subsequently became the first female physician to the Korean emperor in the sixteenth century.¹⁴ During that historical period, Chinese characters were commonly used by Koreans. Thus the written scripts that appeared on screen were often in Chinese ideograms. This contextual element further facilitated translation and dubbing into Chinese languages; the script was dubbed in Mandarin in Taiwan for one year, before it was dubbed in Cantonese in Hong Kong.¹⁵ To further domesticate this particular drama, the Hong Kong TV station intervened directly to provide additional “explanations” in Cantonese voice-over, that is, to offer the Chinese equivalents of the Korean recipes and medicinal items featured on screen. These localizing practices have effectively transformed *Dae* into a “local” drama. Audiences are drawn into consumption of the familiar, which facilitates identification with the characters on screen, and such production practices contribute undoubtedly to the popularity of imported film and TV dramas among the Huaren.

Yet, as mentioned earlier, the “foreignness” of imported Korean and Japanese dramas is an integral part of the viewing pleasures of such transnational audiences

as the Huaren. Foreignness is preserved on screen through various visual elements, especially those that signify “tradition,” for example ethnic food and traditional costumes. “Ethnic” costumes are, possibly, a most convenient and commonly used signifier of culture to display and represent the foreign readily; thus there is no mistaking the origin of an East Asian historical period drama, because Japanese, Korean, and Chinese traditional costumes are distinct from each other. In the case of *Dae*, for example, the costumes of the Korean court are heavily emphasized through visual imagery.

However, most of the regionally circulated dramas are urban contemporary ones, in which few ethnic costumes are featured. In such urban dramas, if the sound is turned off, the relatively similar physiognomy of East Asians renders it difficult for one to recognize the national origin of a drama, especially in indoor close-up shots of the characters on screen, unless one is able to identify the specific actors and actresses. Under such conditions, other vehicles are needed to signify foreignness. The foreign is inscribed in iconic or “slang” images (Khoo, 2006) that metonymically represent the city represented on screen: Tokyo Tower, the telecommunication tower in Shanghai, the Hong Kong ferry, public housing flats in Singapore, the Jeju Island in Korea, and, most generically, street scenes where the neon signs are in local language – the language of the nation producing the programs. The significance of such visual symbols of the foreign for a transnational audience arises from the fact that many of the locations that are featured on screen have also been successfully marketed as tourist sites. TV images are transformed into tourist sites, and TV audiences are transformed into tourists.¹⁶ The pleasure and exoticism of watching the “foreign” is also realized through the tourist gaze (Lee, 2004; Hirata, 2008).

In audience reception, translated and dubbed dialogue domesticates imported TV drama in order to facilitate identification, while the visual exotic foreign raises obstacles to it. Altogether, watching imported TV dramas is a fragmentary process of intermittent moments of identification and distancing rather than one of sustained and unwavering identification with what is on screen (Chua, 2008). This fragmentary process is borne out by empirical studies of transnational audiences in East Asia.

Fragmentary Audience

As in every communicative instance, TV drama narratives construct a reception space and a subject position for the audience; this is a space that induces identification with the on-screen character preferred by the director. However, resistance or rejection of the assigned audience space and its implied subjectivity is obviously always a possibility. In resistance, one would be distancing oneself from the character, the action, and the message on screen. Alternative moments of identification and distancing, where and when on-screen characters are “like me/us” or “unlike me/us,” are generated during real-time watching. For transnational audiences, this identification/

distancing process is mediated – and thus complicated – by an awareness of the foreignness of imported programs, which simultaneously facilitates the process of distancing and raises hurdles for identification.

Identification Ladder: From Human to Asian

From empirical investigations it appears that, during actual viewing time, identification shows a certain order of abstraction: the most immediate level of identification is also at the most generalized and abstract level of simply “being human”; as in some version of the audience response, “I understand the character because we are all humans.” For example, a Singaporean audience member comments:

It’s just that it is filmed in Japan and the characters are Japanese. But when you are talking about love, sex, and marriage, it happens anywhere in the world where someone, in a particular situation, has sex with someone else on a fateful night and then thinks about it and, you know, wonders, ‘Why did I do it?’” (MacLachlan & Chua, 2004, p. 166–167)

Variations of the “we are human” identification can be achieved when a specific element is added to the interpretative frame, for example in a situation where a Taiwanese person refers to a trendy Japanese drama thus: “Love stories in big cities are more *real* for us. We are young. It is what we *dream* of” (Ko, 2004, p. 123); or when a Hong Kong audience member writes on his website: “The major attraction of *Tokyo Love Story* [a Japanese drama] to me is that is not a story about somebody else. It is a story about our generation, about us, about myself” (quoted in Iwabuchi, 2002, p. 146). In these instances a generational claim is made, which thus indexes a more specific segment of humanity.

In a regional context, shared elements – such as language, history, geography – between audience locations and production locations can provide more specific bases for identification, which are less inclusive than “humans/anyone.” In East Asia this phenomenon can take the form of “I identify with the character because we are Asians,” which, ideologically, also says “we are not like non-Asians,” thus implicitly invoking an East–West dichotomy that is pervasive in the public sphere of the countries in the region. This attitude generates and affirms a sense of “Asianness” despite cultural differences between the production and consumption locations. It may be an instantiation of the claim of “cultural proximity.” Iwabuchi (2001a) suggests that such abstraction of being “Asian” generally embraces a loose combination of elements that include, significantly, the shared contemporary global modern consumer culture in all the developed capitalist economies of East Asia. Again, the abstract and general claim of “Asianness” (Iwabuchi, 2002, p. 151) can be further specified with particularistic elements. As the extensive comparative study of Hong Kong and

Singapore women audiences of Korean TV dramas illustrates, “the Confucianist/traditional version of femininities” commonly portrayed in the dramas “provides the most comfortable subject positions for them” (Lin & Tong, 2008, p. 121). This evocation of “Confucianism” as a cultural source of identification isolates East Asians from other Asians.

Significantly, audiences interviewed in the various studies quoted above use the term “identification” to express their sense of “recognition” of themselves in the on-screen characters and narrative messages. However, analytically, this is obviously an overenthusiastic claim, and it cannot be taken literally, as implying that there are identical modes of thought and behavior that link viewers with on-screen characters. Rather, the different abstract frames that allow audiences to engage actively with their favorite dramas are closer to what reception theory has called “repertoire of interpretations” (Hermes, 1999). Nevertheless, despite not being literal, the “Asianness” frame has served as the conceptual basis for a regional “pan- East Asian” identity that has fuelled the cross-border consumption of popular culture – an issue that I take up later in the chapter.

Distancing/Embracing Difference

Crucially, during instances of identification with what is on the screen, the factual foreignness/difference of an imported TV drama for a transnational audience is never erased, but merely displaced and made to lie just beneath the surface of abstract identifications. These emerge as soon as on-screen characters act in a manner contrary to an audience’s sentiment, providing the reasons for the latter to distance itself from what is on the screen. For example, Singaporean audiences of married women apparently have a tendency to reject the Japanese dramatization of sexual relations: “I wish these Japanese dramas would not encourage our youths to accept those one-night love relationships so easily, sleep with each other and that’s it. This is very unacceptable” (MacLachlan & Chua, 2004, p. 163). Here the perceived difference between “they, Japanese” and “Singaporean us” is emphatic and unmistakable. “Foreignness,” standing in for the specificities of the “culture” of production locations, is evoked to create a distancing from more permissive sexual cultures.

This instance of distancing from/rejection of “Japaneseness” has greater conceptual and political implications. As Iwabuchi points out, “Japanese nationalists easily translate this spread of Japanese popular culture to other parts of Asia into the ‘Asia-yearning-for-Japan’ idea, which confirms [for the nationalists] the shift of power from the United States to Japan that took place in the 1990s”; and this implies a “newly generated Japan’s claim for its cultural superiority through asserting commonality with other Asian nations” (2002, p. 66). Iwabuchi further points out that this nationalist attitude is a reformulation and extension of a historically deeper “ambivalence of

the Japanese conception of 'Asia,' a cultural geography that offers Japan at once a shared identity with other parts of Asia and is also the source of Japanese feelings of superiority" (ibid.) – a sense of superiority that underwrote Japan's attempt to colonize the rest of Asia during World War II, transforming it into an Asian "co-prosperity sphere" under Japanese imperial leadership. The possibility of audience distancing from/rejecting "Japaneseness" disrupts the simplistic Japanese right-wing nationalist reading and the cultural imperialist fantasy of interpreting the positive reception of Japanese TV dramas in East Asia as evidence of these audiences' admiration for Japan. Conversely, as Iwabuchi rightly points out, instead of an Asia desiring Japan, this particular reading is more symptomatic of Japan's nationalist desire to "return" to embrace Asia, a desire that has been suppressed as Japan became culturally marginalized after being defeated in 1945 in the Pacific War (Iwabuchi, 2001b). Beyond the specificity of Japanese nationalist sentiments, the possibility of an audience distancing from/rejecting the "foreign" in an imported TV drama undermines any simplistic conception of popular culture as the instrument of a nation's "soft power," which supposedly operates through its ability to influence and win over others through the "attractiveness" of one's values and culture (Nye, 2004).¹⁷

Difference between the local and the foreign can, of course, be viewed positively and engenders a desire for the "other." For example, Taiwanese women viewers express their desire to be like particular onscreen characters: "I have a strong feeling that she is exactly what I want to be" (Iwabuchi, 2002, p. 144) – and, one might add, "but am not," or "but would not be able to be."¹⁸ One particularly poignant instance of this "desiring" difference is that of the effects and changes that the Korean TV drama *Winter Sonata* wrought on middle-aged women in Japan. The first-hand experience of media sociologist Mōri Yoshitaka (2008, pp. 127–128), who was invited by his 65-year-old mother to watch this drama, is worth an extensive quotation:

I was a little bit confused by her suggestion, as I have not watched any TV dramas with her since I left home at the age of nineteen. To my knowledge, she has not been a big fan of TV home dramas at all, as she has always complained about the uncultivated taste of home dramas. Moreover, she had a strong prejudice against Korea and Korean people.

During the 2004 New Year's holidays, I watched the whole series of *Winter Sonata* with her. The drama was, in fact, more interesting than I had expected. However, what interested me more was the way in which she talked about the drama and the hero, Bae Yong Joon (nick-named Yon-sama in Japan), as if she were a girl. I found that she exchanged information about the drama through the Internet or over tea meetings with her friends. She became interested in Korean culture and even travelled to Korea. I started to wonder why *Winter Sonata* fascinated her so much, why Bae Yong Joon could change her idea on Korea, and what will happen to her during and after the Korean Wave?

Middle-aged Japanese female fans turned up in the thousands when Bae arrived in Tokyo airport, thus making visible an active audience practice that is generally

associated with teenage pop culture consumers. The arrival of this demographic of older television fans in Korea transformed the nation from a male sex tourist site to a female “friendship” tourist location. Many Japanese women began to think of the possibility of becoming “cultural brokers,” who can work on changing the image of Korea/Koreans in Japan and even improve the international relations between the two nations (Mōri, 2008). This particular instance of the Korea–Japan encounter in popular culture is obviously determined in part by the colonial/postcolonial relations between the two countries. It nevertheless demonstrates that foreignness or difference can become a source not only of visual pleasure, but also of embracing the other instead of expressing disdain or rejection.

To generalize, substantively what we find, empirically, in the transnational audience’s real-time reception of imported TV drama is an intermittent process of identification with abstract elements attributed to the commonalities between the audience and what is on screen, which often discounts the “culture” of the production location, and a process of distancing from, or embracing, the elements of foreignness/difference that may be attributed to the “culture” of the production location represented on screen. What emerges is, unavoidably, a fragmented audience as a conceptual figure. The factors that can be (and are) invoked – one can imagine for example “global citizenship,” gender, and class – as grounds for identification or distancing are invariably contextual. This opens up opportunities for empirical investigations into how different historical, political, social, and cultural factors can, and have been, evoked in different locations, across different national, cultural, and linguistic boundaries, to anchor specific instances of identification or distancing.

Layers of Audiences

Leisure Audience Community

For the overwhelming majority of audiences, TV drama watching is a leisure activity that fills in the time after the necessary everyday life activities are done, in contrast to the commitments of the fans. Leisure consumers exceed the numbers of fans by wide margins. It is this large leisure audience that accounts for the “popularity” of TV dramas. Indeed, it is impossible to know in any precise manner the size of the leisure audience for a popular drama, except through proxy measures of relative audience ratings. Individual leisure audiences are as widely dispersed across geographic space as the pop culture products: the two cover the same radius. For these audiences, TV drama watching is largely a privatized activity in the home. As a rule, audience members do not seek each other out. The “community” of leisure consumers therefore remains latent and invisible. This may be a reason why the idea of a “community” of leisure audiences is underdeveloped and under researched. This community requires other social institutions to make it manifest and visible. An

illustrative but ubiquitous example of the manifestation of this latent community can be readily observed.

The “popularity” of a TV drama or any other pop culture product is, to a very significant degree, a media-constructed phenomenon. The “heat” of a drama is generated by the attention and coverage it receives from the multimedia culture industry across all its constitutive components – magazines, radios, newspapers, and television channels. For example, when trendy Japanese dramas reached the peak of popularity in Taiwan, *China Times*, Taiwan’s most widely circulated newspaper, “produced a weekly section [spanning an entire page] devoted to discussions of Japanese TV dramas.” Following its success, “many of Taiwan’s publishers began to target the young Japanese TV drama fans. This led to the popularization of a new genre of writing, which combines information on Japanese TV dramas with discussions about Japanese fashion or lifestyle,” with the result that “Japanese TV dramas and other inter-referential texts bind together to create a “mega-text”” (Lee, 2004, p. 133).¹⁹ In places like Singapore, which import television programs (including dramas) from all the production points of the region, a similar production of mega-texts is constructed for the larger East Asian television culture. In such locations, for example, the entertainment pages of local newspapers may be metaphorically read as an “imaginary” geography of East Asian television land – a geography marked by the production locations and a land inhabited by the regional actors and actresses whose appearances in these pages corresponds to the rise and decline of their popularity with the transnational audience (Chua, 2006).

Those who read the pages of this mega-text form a multitude whose members are unknown to one another. When two or more of the readers of these pages happen to be co-present at a social occasion or event and when, as part of the free-flowing social conversation, they exchange impressions and opinions concerning the latest Japanese TV dramas that are drawn from these readings of the mega-text, then a “community of audience members” is instantly materialized. Any item in this mega-text can serve to realize this potential community of leisure audience members. The co-conversationalists would constitute a “community” of at least two persons who share knowledge of the said dramas. When the occasion is over, the community formation gets dissolved. Such instantiation, materialization, and dissolution of “occasional” and “occasioned” communities are part of the practices of the overwhelming majority of leisure audiences. Occasions that give rise to a community of transnational television drama viewers are grounded in incidental face-to-face encounters. Furthermore, they are ubiquitous, although ephemeral and difficult to track. The ephemeral character works against addressing these viewers as part of a stable “interpretive community” (Alasuutari, 1999, p. 7); the latter would be constituted by an identifiable and relatively predictable empirical collective²⁰ – such as colleagues in an office or members of a family – who may adhere to a set of cultural norms. Many questions arise here: Do these ephemeral and ubiquitous occasional communities help to sustain television watching as a dominant global leisure practice? And does the multiplying of occasions where casual viewers engage briefly with

one another contribute to the “popularity” of the drama? Do such occasions provide leisure audiences with a sense of belonging to a larger “community,” outside of their private viewing activities, thus changing their subjectivities? Perhaps the most fundamental empirical question is whether there are any significant differences in the sense of “self” – such as feelings of being more “cosmopolitan,” of “liv[ing] in a larger world than in real life” (Hermes, 1999, p. 80) – when imported TV rather than locally produced dramas become the referential points of conversation.

Activist Transnational Fans

Beyond these ephemeral face-to-face communities of the leisure audience members are the conventional fan clubs, in which avid fans of a particular program, actor, or actress engage in collective activities of sharing information, exchanging paraphernalia, and organize celebrations around events and texts concerning their chosen celebrities. Fan clubs are often organized by corporate agencies to prolong the stardom of the celebrities they manage. The conventional activities of fans have long been a subject of audience analysis, and there is an extensive literature on fandom and fan culture. Constraints of space prohibit a review of this literature here.²¹ Beyond these conventional fan clubs, which remain location-bound in their organized activities, deterritorialized, and faceless but well coordinated, transnational audience fan communities of East Asian television dramas have been, and are being, formed by activist transnational viewers. Such deterritorialized transnational audience communities are enabled by new communication technologies, particularly the Internet, which facilitates immediate communication and organization between fans across geographic distances.²² The following analysis will focus on community formation among activist transnational audiences in the contemporary Internet age.

This is a summary of what happened with one of the Japanese television drama series, *Pride*, as recounted by Hu (2003, pp. 177–178):

In January 2004, a Hong Kong fan, R, who is a skilled Japanese speaker, did the Chinese subtitling for *Pride*, a few days after the original broadcast in Japan. She thanks T and A for their supplies of the raw material, and when she made a mistake in the subtitling, she took care to insert a correction by thanking another fan for pointing out the mistake. The version of R's Chinese subtitling of *Pride* was extremely popular in the Hong Kong newsgroup through its online circulation by means of BitTorrent. [T]he marketing of another version of *Pride* produced by a Taiwanese-based leading pirated-Japanese-VCD company seems to be threatened, because R's version has already been so widely circulated among Chinese fans through the Internet. The inner passions for drama, fan friendship and performance/self-expression are displayed in the context of this Chinese translation/subtitling; being “acknowledged by a community of like-minded is a characteristically romantic structure of feeling.”

The extensive quotation above has all the essential characteristics of a self-organized and self-affirming online community. What is very significant is that, in addition to

being geographically translocal, this community is also transnational and transcultural, on account of the need to translate and subtitle the downloaded drama. This need has produced a new category of audience, known among East Asian media scholars as “subfans”; that is, fans engaged in subtitling. Among the subfans are doctors, lawyers, and other professionals, who are needed because of their special knowledge of medical, legal, and other technical terms in the on-screen dialogue. The quoted description of the fans’ activities clearly points to the high level of organization and coordination work necessary for the entire sequence of downloading–subtitling–uploading–corrections–re-uploading to be accomplished smoothly on every episode of the drama; work is done at different locations without any face-to-face contact among the participants. What drives the language- and technology-savvy consumers, participants, or members to do the painstaking work of initiating and amending the translation and subtitling of their favorite drama series is their consuming passion for the drama. This immaterial labor, in which the audience is a producer of meaning and simultaneously “constitutes itself in immediately collective forms that exist as networks and flows” (Lazzarato, 1996, p. 145), is done entirely for the pleasure and benefit of other members of the cyber-virtual fan community. Such practices of fandom, which extend the economic and cultural reach of television programs, escape the clutches of profit-oriented producers and distributors and elude the radar of censorship and other legal constraints of the nation-state.

Internet fan communities of this kind open up a new research terrain for the study of fandom. Some of the possible research questions are:

First, what are the transformative effects of the activities of subfans – recall here the prior discussion, about the interventions of dubbing and subtitling to the original drama text – both on the actual subjectivity and on the concept of an “active” audience? What do they achieve by taking us beyond the audience interpretation of the message, to an audience that becomes a producer of narrative/message?

Second, how does the immaterial labor of the subfans, who bypass the circuit of commercial broadcast stations, affect how “profit” can be extracted by investors in program production? This is an issue very rarely raised in audience reception research; for now, the investors are left to grapple with the problem of how to configure the “means of the control of communication and information technologies and their organizational processes” (Lazzarato, 1996, p. 146).²³

Third, what kind of cultural politics does the transnational fan community generate in the locations of production and consumption? Some explorations on this last question will be undertaken in the rest of the chapter.

The Politics of a Transnational Audience

Conventionally within media studies the politics of transnational media flows tends to be framed within the twin concepts of cultural imperialism – the perceived negative effects of contamination and transformation that the imported media products

have on the local culture (Morley, 2006)²⁴ – and cultural protection/security – the perceived necessary protection of a local culture against foreign invasion of this kind (Tomlinson, 1997; Xu, 2010). Cultural protection tends to be discussed at the level of state policies that regulate both the quantity of imported media and the scheduling of imported programs, while cultural imperialism gets discussed at the level of US' global industrial dominance and its supposed ideological influence on the audience in the export market locations. The “discovery” of an active audience, whose members interpret the media texts within their own cultural and ontological horizons, effectively puts a dent on the reductionist assumption of hierarchical top-down “cultural influence.” However, the politics of cultural imperialism/protection plays out beyond the actual audience reception of transnational media programs. It spills over into this larger public political sphere, either in the location of production or in the location of reception. Two instances drawn from the East Asian television drama industry illustrate these two possibilities of the politics of transnational popular culture's flow and reception.

The first concerns Korean television actor Song Seung-Heon. In 2004, when he was a “hot” idol among East Asian audiences, the news broke that that he had “cheated” conscription to military service by faking his medical record. In a country that is still divided into a communist north and a capitalist south, where the veterans of the bitterly fought Korean War in the early 1950s are still alive, and where the two halves of the nation continue to be in a state of military alert because the uneasy peace is maintained by an armistice rather than a peace treaty, conscription is seen as a critical national duty of every male citizen. Furthermore, as a compulsory national duty, conscription is seen as the great “leveler” of social, economic, and political inequalities among Korean men. In such an intensely politicized atmosphere, any attempt to escape conscription is an extremely anti-patriotic act. The disclosure of Song's misdemeanor created a public outcry.²⁵ Pressured by such a nationalistic response, the government immediately hauled Song into the military, although at the time he was shooting a video on location in Australia. The government's action immediately provoked Song's fans across East Asia to mobilize and organize a letter-writing campaign designed to plead with the Korean government to allow Song to complete his video before enlistment. Knowing the sensitivity of military service to Korean citizens, the fans did not plead for exemption but merely for delay in enlistment. The fans argued that Song was making a much more significant contribution to the Korean nation, not only economically but also in cultural diplomacy, through his dramas. The campaign was to no avail. Song abruptly abandoned the shooting, returned to Korea, and was enlisted without undue delay.²⁶ This instance demonstrates the possibility of activist transnational fans organizing themselves to intervene in a sensitive political situation. From the national political point of view, fans organized an extraterritorial intervention into the domestic political sphere of the exporting location. Admittedly, as this instance demonstrates, it seems difficult to imagine how such transnational fans' activities could have any significant impact on the domestic politics of the exporting country.

In contrast, the second instance concerns the politics of audience reactions in the importing/reception location; and this is played out through contestations between audiences and non-audiences of imported TV dramas. Empirically, within any importing location, the size of the audience population of transnational media TV dramas is much smaller than the size of the non-audience population. This disproportion is of great significance in the cultural politics of the importing location. Issues arise when the non-audience – for whatever reasons, including broad nationalism, historical animosity between the importing and exporting nations, professional envy of local artistes against foreign ones – reacts negatively in public to the importation of foreign dramas.

The regional success of Korean popular culture has given rise to very vocal anti-Korean sentiments in many East Asian locations. In Japan, a series of “Hate the Korean wave” (*Kenkanryu*) comics has been published. In this context, the Japanese women, audience members of Korean TV dramas who imagined themselves as harbingers of change on the grounds that they “warmed” the relations between Koreans and Japanese, are likely to face a steep uphill task, especially with the continuing historical resentments of the colonizer–colonized antagonism between Japan and Korea. In Taiwan, the arrival of Korean pop culture has been metaphorically described as the “invasion of Korean wave.” Such anti-Korean public discourse “militarizes” the importation of Korean pop culture, suggesting a serious violation of Taiwan’s national borders. On the day when Bae Yong Joon, the star of the hugely popular drama series *Winter Sonata*, visited Taipei to promote his movie, *April Snow*, self-styled “nationalist” Taiwanese rock musicians staged a concert to lambast Korean popular culture and Bae himself. Significantly, as the audience of Korean TV dramas is largely female, the rock musicians also directed their sexist masculine rage against “foolish Taiwanese women” who were fooled by the “love, smiles, and good looks” of male Korean TV stars (Yang, 2008, p. 203). In China and Hong Kong, media professionals, including the star of action comedies Jackie Chan, protested against the extensive coverage that local media gave to visiting Korean artists. In all these instances, cultural nationalism, professional jealousy, and self-interests are inextricably blended to generate a call launched by lay non-consumers and media professionals to support local artists. The rallying call is ideologically framed as “expressing” and “representing” national interests – indeed nothing short of “national cultural preservation.”

In both these examples, the sphere of popular culture rubs up against the larger public sphere – specifically, against the politics of confrontation between transnational pop culture and nationalism. The contestation that ensues is an ideological one, in which one side is reinforced not only by numerical superiority of “citizens,” but also by the availability of the rhetoric of “nationalism.” In the case of Song, the intensity of Korean nationalist investment in compulsory military service clearly overrides the extraterritorial politics generated by Song’s regional fans, in spite of the fact that the export of Korean popular culture has become one plank of the nation’s export industry. In the more pervasive case of anti-Korean popular culture,

which can be found in different East Asian locations, the “foreignness” of imported TV dramas serves as an ideological resource for non-consumers to politicize local reception. Non-consumers and domestic producers of popular culture can readily use their demographic majority to “anoint” themselves as the “people,” the ones who “defend” the “national” culture against foreign cultural “invasion” or “cultural imperialism.”

In these two instances, the “nationalists” in the exporting and importing nations, respectively, made strategic use of the sign of the “nation” by discursively invoking its particular legislation on conscription, or the imagined threat to its culture from a transnational audience. The Korean nationalists ideologically prioritized national security ahead of the national economic interests invoked by the regional fans in their letters. The non-consumers of Korean pop culture in various East Asian locations frame and exclude the audience/consumers of Korean TV dramas as “anti-nationalist cultural traitors.” In both instances, obviously, the self-interested national government is complicit with the nationalists. This politics of transnational media culture flows inevitably raises obstacles to any theoretical or substantive desire to conceptualize a harmonious “pan-East Asian identity” among East Asian TV drama audiences. Such an identity, if it emerged at all, will be unavoidably an identity of a minority, which is fragile and contested in any locality.

Pan-East Asian Identity?

The increasingly regional integration of television’s popular culture economy in East Asia is evident not only in TV dramas, but perhaps even more conspicuously in blockbuster movies with actors, actresses, and investors drawn from the different countries in the region. With an expanding regional transnational audience population across different entertainment media, the question of the potential emergence of a pan-East Asian identity unavoidably arises. Indeed interviews with TV drama audiences often elicit comments that point to an identification with on-screen characters and actions on the basis of an unspecified idea of “Asianness.” The potential for such a regional identity is facilitated by the following factors: first, the relatively similar physiognomy, which allows for regional audiences’ “recognition/identification” with on-screen characters; second, aspects of shared premodern histories and co-eval contemporary capitalist development and consumer culture; and, third, supposedly strong family themes that are often read as reflections of a Confucian emphasis on the family as the fundamental unit of society and filial piety.²⁷

However, analyses of TV drama audience reception have uncovered factors that present obstacles to the establishment of a stable “pan-East Asian” identity. First, the identification with any element that may be constitutive of an abstract Asianness is intermittently but persistently being disrupted by audiences’ recognition of their difference and distance from the foreign culture represented on the screen, which

makes identification unstable. Second, for the overwhelming majority of audiences, viewing is a leisure activity, residual to the necessary routines of everyday life. In the unending layering and interaction of a constant stream of cultural knowledge acquisition that goes into individual identity formation, the impact of such residual activities is likely to be rather weak, as there are no social institutions that enforce compliance and offer payoffs to viewing. Third, both the life of a TV drama and the length and depth of audience loyalty are equally ephemeral. While there may be identifiable East Asian TV drama audiences that belong to either loyal fan communities or to ephemeral collectives of casual viewers, membership in these groups is always changing; as one fan grows out of a group, a new one joins in quick succession, simply following the rise and fall of a constellation of dramas and related celebrities. The duration of active consumption, even fandom, is often too short and amorphous to produce a stable community, and therefore such phenomena may not be capable of generating lasting effects on individual identity formation. Finally, as suggested earlier, we have to recognize that, if a pan-East Asian identity were to emerge at all among audiences of East Asian TV dramas, it would be that of an “excluded” minority in all the local national contexts, because such an audience formation can run up against local nationalist sentiments that resist foreign media culture products. At this point, the possibility and process of a pan-East Asian identity formation still remains at the level of an empirical question. Meanwhile, at the individual level, the TV dramas that viewers love to watch have definitely been etched into these viewers’ memories, and may in some ways even change their personalities and their lives, as the case of the Japanese female audience for the Korean drama *Winter Sonata* illustrates. Today’s audiences would undoubtedly be able to recall at some future date, with fond nostalgia, the period when such consumption of popular culture was an important part of their everyday life routines.

For an Analytic Framework

To begin to elaborate a framework for the analysis of a regional transnational audience, it is necessary to examine closely the actual viewing practices of such an audience. If “recognition” is indeed central to viewing pleasure (Ang, 1985, p. 20), then, it is necessary to examine how recognition is facilitated across linguistic, cultural, and national boundaries. For a transnational audience, the process of recognition/identification with on-screen characters and narratives is not a straightforward process of “seeing oneself” represented on screen. It is a process that is always mediated by an awareness of the differences between the culture in which the subject audience is embedded and the “foreign” culture of the production location that is portrayed on screen. The “foreign” can simultaneously raise obstacles to easy recognition/identification and constitute an intrinsic part of the viewing pleasure. This mediation is further complicated by the fact that viewing is usually

facilitated, or mediated, by subtitling or dubbing – or both. Again, a double character is evinced. While subtitling and dubbing, particularly the latter, are aimed at suppressing, indeed erasing, the foreign in order to “domesticate” the content, they simultaneously remind the audience of, and in this sense they “preserve,” the foreign. Analysis needs to pay attention to the simultaneity of identification and difference and to the mediation of subtitling/dubbing in transnational audience viewing practices.

Second, it is necessary to differentiate the audience “mass” into conceptual/substantive categories of audience(s), with different viewing and related audience practices. The audiences of TV dramas can be categorized according to their commitment of time and activities, financial expenses, and “loyalty” to the genre in general – in the form of watching every drama possible; to a particular drama series; or, finally, to a specific celebrity stars/idols.²⁸ Three categories of audience can be identified: (1) the “leisure” audience, that is, one that does nothing more than watches TV for casual entertainment; (2) “fans” who go beyond merely viewing to participate in other activities of fandom, including joining fan clubs, going to fan parties, collecting memorabilia, and chasing after visiting drama actors in locations that range from airports to shopping centers; and (3) activist transnational fans who, in addition to doing all the conventional fan activities, will spare nothing to devote their time and energy to participating in internationally organized activities that support their television stars or idols. The emergence and consolidation of this last category of audiences has been facilitated by the development of new computer-based communication technologies that facilitate transnational communication, particularly the Internet. These fan categories obviously overlap. In terms of viewing habits, there is a descending order of engagement. A transnational activist fan is clearly also a fan and a leisure audience member, all rolled into one; while fans may not become activists in international organized fan activities, they are also clearly members of a leisure audience; finally, a leisure audience does not get involved in any serious fan activities. In terms of size of audience, the rank ordering is reversed: leisure audiences are demographically the largest, followed by fans, and then by transnational activist fans. Corresponding to the three audience categories, there are different notions of belonging to a “community” of viewers.

Third, beyond the actual television screen and audience viewing practices, there is the politics that comes with the “penetration” of foreign media cultural products into local cultural space. Within these frames, analyses tend to be stuck at the level of ideological debates around the global dominance of the US media industry and the local resistance this generates. The analysis of transnational audiences needs to examine how perceptions of nationalism and cultural imperialism play out in the attitudes and behaviors of audience members and non-audience members of imported media products. The hostility of some non-audience members toward the consumption of foreign TV programs, as in the case of Korean or Japanese dramas in Taiwan or China, shows that transnational television can cause rifts and divisions among the citizens of a particular nation.

The above elements are by no means the only factors that are necessary in order to create a framework for the analysis of transnational audiences – a prevalent phenomenon in the age of media globalization. Indeed, when we draw on empirical analyses of the regional East Asian television industry, we may find that these elements offer material for substantive conceptual considerations, but we still need modifications, elaborations, and additions for a richer analytic framework that can do full justice to the phenomenon.

Conclusion

Airwaves respect no artificial national boundaries, and television as a medium is intrinsically transnational. However, television content and its audience are respectively embedded in the cultures of the location of production and of the location of consumption. Content that flows across national boundaries also traverses cultural boundaries, thus creating a transnational audience. One such formation in the past two decades has been the emergence and integration of the East Asian television industry. Drawing on empirical studies of the regional audience of East Asian television, this chapter has attempted to map out a preliminary framework for levels of analysis of audience reception and audience formation processes, from accounting for individuals to accounting for communities of the nation and, finally, of the region. At each level, the reception process and the audience formation process are tied to empirical specificities pertaining to the difference between the location of production and the location of consumption, which opens up discursive spaces for a comparison with transnational audience formation elsewhere in the globalized media world.

NOTES

- 1 This transnational audience is different from diasporic individuals who watch from their present residential location programs coming from the home country. The case of the latter has been discussed conceptually by Appadurai (1996) and analyzed empirically by Robins and Aksoy (2006).
- 2 *Huaren* is used as a relatively “neutral” term for specifying Chinese ethnicity, because the English word “Chinese” does not distinguish between national and ethnic identities; a Chinese from the People’s Republic of China is Chinese with respect to both national and his ethnic identity; a Singaporean Chinese is *Huaren* by ethnicity, Singaporean by nationality.
- 3 Chua (2001) has discursively conceptualized this regional *Huaren* pop culture network as “pop culture China.”
- 4 There was an earlier history of popular Japanese martial arts movies, such as the *Blind Swordsman* series, the among *Huaren* audience. These movies were influential in the development of a martial arts genre in Hong Kong (see Yau, 2005).

- 5 The ban was lifted in October 1998, with the Joint Declaration of the New Twenty-First-Century Korea–Japan Partnership.
- 6 “U” sounds similar to the Chinese word 尤., meaning “excellent.”
- 7 To the extent that pop culture is the culture of the masses, it is a constitutive part of the larger popular culture. The latter includes local cultural practices of long standing – what we call “traditions,” religion, and other folk practices that, according to Stuart Hall (1981), may have greater potential for political and social change.
- 8 The groundbreaking study here is Ien Ang, 1985 (*Watching Dallas*).
- 9 TV programs are often broadcast in “dual sound,” so that the audience can choose between dubbed local language and the original language with local-language subtitles.
- 10 In addition to lip-synchrony, dubbing must also pay attention to “kinetic synchrony” – synchrony with bodily movements on screen – and to “isochrony” – synchrony in the timing of characters’ utterances on screen (Varela, 2004, p. 41).
- 11 Before dubbing can take place, a translation of the given script has to be undertaken; this is followed by “synchronization of the translated dialogue so that it matches the actors’ mouth movements and the other images as closely as possible” (Martinez, 2004, p. 4).
- 12 In the East Asian instance, the question of audience’s preference for the “cultural proximate” in foreign products is clearly multilayered, including physiognomic, historical, and civilizational layers. For a detailed discussion of these layers, see Iwabuchi (2002a).
- 13 Limitations of space do not permit a more detailed elaboration of this multilayered cultural proximity; see Iwabuchi (2002a).
- 14 To be consistent with actual practice during the sixteenth century, all written documents presented on the TV screen, from reports at the imperial court to personal letters, are written in Chinese characters, not in Korean alphabet.
- 15 Significantly, many in Singapore prefer the Cantonese to the Mandarin version, supposedly because of the “greater authenticity” effect of colloquial expressions, by comparison with the relative “stiffness” of the Mandarin version. This is more likely an expression of resistance to the official imposition of Mandarin as the only language of broadcast media.
- 16 The Korean tourism industry consistently uses Korean pop stars in all its advertisements.
- 17 Since the mid-2010s, politicians and policymakers in Korea, Japan, and China have been pushing the idea of popular culture exports as an instrument in soft power competition in the region; see Li (2008), Otmazgin (2008), and Lee (2009).
- 18 Iwabuchi invokes Dyer’s (1992) explanation of such audience sentiments: entertainment provides consumers with the possibility of experiencing “what utopia would feel like.”
- 19 Lee borrows the idea of the “mega-text” from Su, 1999.
- 20 That the audience is an empirical collectivity needs to be emphasized against the idea of the audience as what Ien Ang (1991, pp. 33–37) calls the “taxonomic collective,” used in TV industry.
- 21 For a representative and comprehensive review of fandom, see Lewis, 1992.
- 22 Such self-organized community differs in very significant ways from the fan clubs organized by media agencies with a view to consolidating the popularity of its stable of actors.
- 23 I would like to flag here the immense potential, as yet unrealized, that the concept of immaterial power holds for the analysis of audience reception theory.

- 24 The central argument of the “cultural imperialism” thesis has become complicated; it has moved beyond the simplistic assumption of a direct cultural impact of the foreign on the local, to include the export of formats from the US and the incorporation of the US model and of the path of television industry development (see Shi, 2008, pp. 1202–1203).
- 25 Cheating of the draft, by children of the rich and powerful, always generates public criticisms and imposes heavy costs on the future of the perpetrators when they are exposed.
- 26 For more details on this case, see Eva Tsai (2007).
- 27 In actual fact, the family as an institution is portrayed very differently in TV dramas from the different regional countries (see Kang & Soo, 2009).
- 28 “Idol” is a common term of East Asian fandom, which designates a “personalized” relationship between the fans and the favored actor. It signifies someone to “worship” and to “emulate.”

Language and Indian Film Audiences

From Political Economy to Ethnography

Sunitha Chitrapu

ABSTRACT

This chapter makes a case for political economy and audience studies to complement each other, using Indian film audiences as an illustration. From a historical point of view, linguistic diversity has played an important role in state formation and politics on the one hand, and in the sphere of media and culture, including Indian film production, on the other. The reception literature on Indian film audiences reveals that films in the local languages hold great attraction for speakers of these languages; however, expensive and slick productions in languages other than the mother tongue do sometimes manage to capture audiences as well. Further, the language of a film determines its territorial site of viewing and therefore the extent of revenues that can be earned by that film; additionally, class acts as another mediator of film consumption. Film audiences in states with larger linguistic populations have access to a different set of films from the one accessible to film audiences in states with smaller linguistic populations. Fleshing out these connections, the present chapter raises questions that are of interest to audience research. If political economy directs audience studies toward considering the influence of regulations, policies, and the economics of production and distribution on film viewers' taste cultures, the messy realities and contradictions uncovered in audience ethnography can challenge political economy to incorporate social and cultural theories in order to modify its tendencies toward economic determinism.

The cultural imperialism perspective considers the one-way trade in films and television programs, from West to East, to be rooted in imperialist ambitions to control former colonies, and it fears that this flow would be harmful to native cultures in non-Western nations (Beltran, 1978; Guback, 1969; Mattelart, 1973; Nordenstreng & Varis, 1974; Schiller, 1969). Certainly, early analyses of international communication found a pattern of “one-way traffic” in television programming, from developed countries in the West like the United States, the United Kingdom, France, and Germany to developing countries in Africa and Asia (Varis, 1974). However, later studies showed an increase in “regional exchanges,” particularly in Latin America and in the Arab countries, where media content from adjacent countries began to be traded, and in particular, films from India, Hong Kong, and Taiwan were found to be popular in other parts of Asia (Varis, 1984).

Indian film exports to countries in Africa, Europe, and the former Soviet Union have been further documented by a number of scholars (Abu-Lughod, 1993; Bradeanu & Thomas, 2006; Eleftheriotis, 2006; Iordanova, 2006; Larkin, 1997; Meyer, 1999; Muhammad, 1992; Rajagopalan, 2006; Van der Steene, 2009; Vasudevan, 1995). Media economics researchers studying the international trade in media products observe that, in general, countries that have large and wealthy domestic markets are able to create media products (such as films) that are popular when exported because, while audiences prefer cultural proximity in media content, there is also a preference for well-produced – in other words, more expensive – content (Hoskins & Mirus, 1988; Waterman, 1988; Wildman & Siwek, 1988). A large domestic market is therefore an asset to a film industry that has international aspirations.

In a similar vein, Thomas Guback’s (1969) question – “If all industries are trying to export films, what occurs within markets?” (p. 14) – highlights the importance of investigating domestic markets for films. Thus, when scholars want to examine the international presence of Indian films, they would need to begin with an exploration of the domestic Indian film market’s social and economic contours. While it is well known that more films are produced each year in India than in any other country of the world, what do we know about the audiences that support such a high film output? In other words, what do we know about the demand for films in India’s pluralistic social and economic environment? There is still much to be discovered, learned, and understood about film audiences in India. With such a large and diverse population and a prolific film industry, India presents many rich opportunities to study film audiences.

One of the most prominent features of the Indian film market is the sheer diversity of its audiences. This diversity is not only in economic status, but also in culture and language. A staggering 22 languages are recognized as official languages in Schedule VIII by the Indian Constitution, while the total number of languages and dialects used by Indians runs into the hundreds. In economic terms, linguistic concerns are key components of a media market, because language determines access to, and therefore demand for, a media product (Wildman & Siwek, 1988).

India belongs to a tiny minority of countries (including Canada, Belgium, and Kenya) where films are produced in more than one language. Indian films have been produced in over 60 different languages ever since the beginning of sound film in 1931. When we consider this principal feature, we realize that, when it comes to media products such as films, India is not a monolithic national film market but a mosaic of different language markets that are dependent on the size and prosperity of the speakers of each language. One can, then, immediately make sense of the fact that the language spoken by the largest number of speakers – Hindi – is also the language in which the largest number of films have been made (starting from 1931, when language assumed importance in films as a result of the advent of sound), that Hindi films have higher budgets than films in most Indian languages, and that they are also the most popular exports. While the number of Hindi speakers is in the region of 400 million (as reported by the Indian census in 2001) – and this is certainly a large number compared to that of speakers of other languages – in terms of wealth, and hence of the share of disposable income that can be spent on film viewing, this Hindi-speaking audience is by no means in the same league as the slightly smaller but comparatively wealthier American audience for films produced in Hollywood. Thus it becomes apparent that Hindi films might do well in international markets that are smaller and less wealthy, such as in Africa or in Eastern Europe, but may not be as popular in larger, wealthier markets. Researchers such as Larkin (1997) have also observed that cultural proximity may work in favor of Indian films in some smaller markets in other non-Western contexts, as is the case in Nigeria. Language thus plays a crucial role in film production through its effect on market size, and therefore on film production budget and output; and, as we shall see in a later section, it plays a crucial role in film consumption as well.

While class and gender play an important role in shaping the reception of Indian films among diverse audiences, this chapter focuses primarily on the linguistic dimensions of audience demand for Indian films. Given the complex nature of Indian cultural production and consumption, a holistic, critical framework such as that advocated by the political economy approach allows us to take a “big picture” view of Indian film viewing. Through the breadth of analysis offered by this approach, a more nuanced understanding of findings from ethnographic studies of audiences becomes possible. In other words, political economy helps us understand “why,” while ethnography provides indispensable answers as to “how.” Combining the two approaches allows us to proceed from “how” to “why,” and our understanding gains both depth and breadth.

This chapter is divided into four parts. The first part introduces the reader to linguistic diversity in India, looked at from a historical point of view, from colonial times till the present day. The second part foregrounds the economic effects of linguistic diversity on Indian film production in the context of political economy. The third part examines the reception literature on Indian film audiences. The concluding part presents some implications of using the political economy perspective while doing ethnographic studies of Indian film audiences.

Linguistic Diversity in India

Language use in India is deeply tied to a person's distinct ethnic, regional, caste, and family background, and hence language and dialect preferences are slow to change. A study of the history of language policies in India reveals that neither Persian, which was introduced by the Islamic rulers as the language of the administration, law, and commerce, nor English, which was introduced by the British to aid in colonial rule, managed to replace the use of existing languages (Schiffman, 1996).

The language policy of the British colonial administration highlights the enduring significance of Indian languages. When India came under the rule of the East India Company, Persian and Hindustani continued to be used in the provinces as exclusive languages of the administration until the 1830s, when the Company's Court of Directors observed that knowledge of other Indian vernacular languages was also desirable. Going beyond Persian and Hindustani, lesser known Indian languages were given an official role from 1837 onwards, when a more diverse palette of regional languages started to be used by the colonial administration in the provinces. The colonial administration's patronage of these vernacular languages was motivated by concerns of efficiency and legitimacy and by utilitarian ideals of justice (Mir, 2006). Mir observes that "the records acknowledge that local linguistic practices were complex, and that vernacular languages were critical to effective rule" (p. 399).

The East India Company further acknowledged the importance of regional languages to colonial rule through its emphasis on language training for Company officials. In the south of India, in Madras (present-day Chennai), the Company set up a vernacular-language training centre in Fort St George and arranged for monetary incentives to officials in training for completing language training in Persian and Hindustani – but *only* if they had already acquired the necessary level of proficiency in a "native dialect" (Mir, 2006).

Further evidence of the priority accorded to regional languages in India is seen in the actions of the church. The church took note of the value of allocating resources toward learning and teaching the local languages to support its evangelical activities. In the nineteenth century missionaries wrote dictionaries, grammars, and guidebooks in various Indian languages (Schiffman, 1996). They also translated the Bible into Indian languages and mapped the regions of India by the languages spoken; in 1822 the Baptist Missionary Society released a language map of 47 Indian languages (Mir, 2006). In time, however, the English language created professional opportunities for Indians that led to its widespread adoption in business and government affairs; but Indian languages continued to be important (Schiffman, 1996). The complex balance between English and various Indian languages thus has a historical precedent dating back to colonial times in India.

During the struggle for freedom Gandhi recommended the use of Hindustani in place of English; the Congress Party favored the use of Hindi, which was resisted in non-Hindi speaking parts of the country (ibid.). After India's independence from

colonial rule in 1947, linguistic concerns played an important role in Indian politics. Within the first decade of independence, state boundaries were redrawn on a linguistic basis. While Hindi and English were constitutionally mandated as “national languages,” non-Hindi states resisted the “imposition” of Hindi, and this situation eventually led to a compromise known as the “three-language formula,” whereby school education in non-Hindi areas would include English, Hindi, and the local language, while in Hindi areas students would learn English, Hindi, and another Indian language (*ibid.*).

In time, however, Hindi language teaching took precedence in Hindi areas, whereas non-Hindi areas paid greater attention to English and the local language (*ibid.*). As Laitin (1989) points out, “[c]itizens develop complex language repertoires in order to interact with servants, family, merchants, colleagues and officials” (p. 415). A resident of a state like Bihar, where Hindi is the state language, needs to know only two languages, while the speaker of a minority language in a state where his mother tongue is not the state language will have to learn four languages: his mother tongue, the state language, English, and Hindi (Laitin, 1989).

Census statistics reveals that 24.79% of Indians are bilingual and 8.51% are trilingual (Census of India, 2001). Laitin’s (1989) position – the view that speakers of minority language groups will have to learn more languages – is borne out by census figures. For instance, almost 75% of those whose mother tongues have populations of approximately over 1 million speakers, such as Konkani and Sindhi, tend to be bilingual and between 35% and 50% of these speakers are trilingual (Raghuraman, 2010). As the size of the population speaking a certain language grows – as in the case of Punjabi, which is spoken by over 25 million people – bilingualism falls to 50%, and in the largest language groups it falls further – to 20% in Tamils and Bengalis, and to 12.5% in the largest language group, that of Hindi speakers (*ibid.*).

Thus we find that, from colonial times, regional languages have remained significant in India. The linguistic reorganization of states underlines the importance of regional languages, despite the decision to use English and Hindi as national languages after independence. The following section analyses the effect of this linguistic diversity on film production in India.

Political Economy and Linguistic Diversity in the Indian Film Industry

The study of economic structures, relations of production, and political systems that protect particular economic structures is the main concern of the political economy research approach to media (Meehan, Mosco, & Wasko, 1993). The roots of political economy can be traced back to Adam Smith and David Ricardo in the eighteenth century, when the relations between society and the decisions on economic resource allocation began to be studied; this study was followed by writings of Marx and

Engels, which outlined a normative/ideal economic model (“what ought to be”) that emerged from a critique of the capitalist mode of allocating resources (Wasko, 2003). The political economy approach emphasizes social change and history, social totality, moral philosophy, and praxis as its four central characteristics (Meehan et al., 1993; Mosco, 1996; Wasko, 2003); thus political economy takes a critical rather than a “celebratory” approach and uses methods from economics, sociology, and political science (Wasko, 2003).

The role of historical analysis is emphasized because it allows us to examine social change (*ibid.*). Underlining the importance of institutional analyses in the political economy approach, Garnham (1995) asks: “How is it possible to understand soap operas as cultural practices without studying the broadcasting institutions that produce and distribute them, and in part create the audience for them?” (p. 71). An understanding of the economic context is key to political economic analysis. Emphasizing an understanding of the capitalist context of media production and consumption, Meehan (2000) observes: “As human beings living in social collectivities, we do make culture – but in the context and within the limitations of capitalism” (p. 90). This is echoed by Garnham’s (1987) definition of cultural production “as the production and circulation of symbolic meaning, as a material process of production and exchange, part of, and in significant ways determined by, the wider economic processes of society with which it shares many common features” (p. 25).

In the history of Indian film production, the foreign exchange shortages experienced by the newly independent Indian nation in the 1950s led to a limit being set on the number of American films that could be imported into the country, because revenues earned by American film studios in India could not be repatriated to their home country (Pendakur, 1985). These limits continued until they were lifted in the mid-1990s, in a newly liberalized India. Indian film production thus occurred in the context of this limitation on competing imports. Second, unlike in the US, where film production and distribution are controlled by a small group of companies, a large number of companies of various sizes participate in Indian film production and distribution (Pendakur, 1990). Third, Indian films are subject to government censorship, a carry-over from colonial times, and this restricts the types of subjects that are addressed and the way in which they are addressed in Indian films (Pendakur, 1992). Fourth, Indian films have traditionally earned a greater share of their revenues from the domestic market than from exports (Pendakur & Subramanyam, 1996). Fifth, from the arrival of the video in the 1980s, piracy has been prevalent in the Indian film market (*ibid.*). All these factors play a role in shaping Indian film production.

Political economy scholars have examined the pressures that the unique economic properties of media products exert on media producers, who are constantly struggling to maximize their audiences in a chaotic and unruly media environment. These properties include relatively negligible reproduction costs compared to the cost of creating the media product in the first place (the first-copy cost), non-rivalrous consumption (a person’s use of a movie does not interfere with another person’s use of the same movie), and non-exclusive consumption (which involves the difficulty of

excluding those who have not paid to use the media product) (Garnham, 1995). For instance, even those members of the community who do not support their public radio station can still listen to it. These economic properties of media products lead media producers to maximize their audiences by pursuing monopolistic practices of media concentration or internationalization and cross-media ownership (*ibid.*). Writing about the economic imperatives that shape media production, Meehan (2007) thus notes that, “[w]ith an understanding of the rules and relationships governing cultural manufacture, we are better positioned to appreciate how the popular becomes popular” (p. 161).

Larkin (1997) highlights the importance of examining the political economy of the Indian film industry on the grounds that it clarifies “the relation between the economic and symbolic reasons for its popularity” (p. 411). We will see in a later section how economics plays a fundamental role in the ways in which films are made in Indian languages and in the fact that films made in some Indian languages enjoy advantages over others – in other words, it explains how popular Indian films become popular.

India is unique in that it is one in a handful of countries in the world where films are produced in a multitude of languages. Almost all other film producing countries make films in one national language. Of course Belgium, Canada, and Kenya are the notable exceptions. Belgian films are produced in Flemish and French (Mosley, 2001). Canada produces films in English, French, and some aboriginal languages. Even a linguistically diverse country like Indonesia only produces films in the national language (Heider, 1991). In contrast, as mentioned already, Indian films have been produced in over 60 different languages (not merely dialects) since 1931. In 2005 official records showed that a total of 1,041 Indian films were produced in 25 different languages.

The coming of sound was the technological event that triggered film production in Indian languages. The first sound film made in India was *Alam Ara* in 1931. Indian films began to be produced in the many languages spoken on the subcontinent (Thoraval, 2000). Barnouw and Krishnaswamy (1980) observe how this “discord of tongues” fragmented the large Indian film market into smaller markets, differentiated by language.

India thus resembles a federation of several film markets like the European Union rather than a national film market. In other words, it is a regional mosaic rather than a monolithic national film market. An examination of the economics of film production in India reveals that, statistically, production in Indian languages is significantly related to the size and wealth of the linguistic population: larger and wealthier linguistic populations support greater film production (Chitrapu, 2008). More films have been produced in Hindi (9,937) during the 75-year period from 1931 to 2005 than in any other Indian language, and production in the Tamil (6,362), Telugu (6,183), Malayalam (3,528), Kannada (2,798), and Marathi (2,628) languages follows – in exactly this order.¹

Further, film production in languages spoken by larger linguistic groups started earlier. The first sound film was made in Hindi in 1931. Official records show that

film production in Bengali and Tamil also started in that same year. Production in Telugu, Gujarati, and Marathi began the following year, in 1932. Other languages soon followed them in the industry: Kannada in 1934, Punjabi in 1935, Assamese in 1935, Oriya in 1936, and Malayalam in 1938. The languages with the largest film production all got their start within the first decade of the arrival of sound.² This order closely follows that of the percentage of speakers of these language during that influential decade. Barnouw and Krishnaswamy (1980) report that the linguistic populations at that time were as follows: 140 million Hindi speakers, followed by the Bengali (53 million), Telugu (28 million), Marathi (21 million), Tamil (20 million +), Punjabi (15 million), Gujarati and Kannada (11 million each), Malayalam (9 million), Assamese and Oriya (2 million each), and Kashmiri (1 million) (Chatterji, 1945, cited in Barnouw & Krishnaswamy, 1980, p. 59).

The linguistic reorganization of states in the first decade of independence helped different sections of the Indian film industry to consolidate their audiences geographically. Moreover, the newly constituted states supported and funded cultural production in the state language. In some states, film production in the state language was supported by the state government through subsidies, low-interest loans, the development of film production infrastructure such as production and post-production facilities, favorable rates of taxation compared to those available for films in other languages, and also film awards (Pendakur, 1990). According to historian Ramchandra Guha,

The movements for linguistic states revealed an extraordinary depth of popular feeling. For Kannadigas and Andhras, for Oriyas and Maharashtrians, language proved a more powerful marker of identity than caste or religion. This was manifest in their struggles and in their behavior when the struggle was won. One sign of this was official patronage of the arts. Thus great effort, and cash, went into funding books, plays and *films* written or performed in the official language of the state. (Guha, 2007, p. 207, italics mine)

Since trying to understand the effects of linguistic diversity on the international trade in Indian-language films, I found four patterns related to the size of linguistic film markets in India (Chitrapu, 2008). As the size of the linguistic market increased, (1) film production budgets increased; (2) film exports increased; (3) audiences were exposed to a greater variety and number of films, both originally produced in the local language and dubbed; and (4) audiences were exposed to a greater variety of genre elements in films.

First, larger linguistic markets generally support films with bigger production budgets. Hindi film budgets are generally the largest in the country, which mirrors the fact that Hindi/Urdu speakers form the largest language group, comprising almost 40% of the Indian population. The next largest and wealthiest Indian-language film markets are found in the four southern Indian states of Tamil Nadu, Andhra Pradesh, Karnataka, and Kerala, which feature among the top 10 Indian states in terms of their gross state domestic product.³ In general, filmgoing is positively related

to income: well-off audiences see more movies and more types of movies than their less well-off compatriots (Barnett & Allen, 2000). This is true in the four southern states, which together supported approximately 59% percent of Indian cinema theaters in 2003 (Distribution of Theaters, 2004, p. 19). These markets produced large numbers of films and supported high production budgets.

Second, larger linguistic markets show greater numbers of film exports. For instance, more Hindi films than films produced in other Indian languages are exported and find a place on the popularity charts in other countries such as the USA, UK, and Australia.⁴

Third, film audiences in larger linguistic markets were exposed to more films produced in their own language, and also had access to more imported films dubbed into local languages than audiences in smaller linguistic markets. In the nine-year period from 1996 to 2004, 95% of films that were dubbed were dubbed into Telugu, Tamil, and Hindi. However, while these three linguistic markets were more open to dubbed films in terms of absolute numbers, in relative terms these films only formed a small proportion compared to the films actually produced in these languages.

Fourth, films made in larger linguistic markets carried a greater variety of genre elements. Genre elements reported by the popular website www.imdb.com for 679 films produced in the top six languages of film production in India – Hindi, Telugu, Tamil, Malayalam, Bengali, and Marathi – in the three-year period from 2003 to 2005 were examined. Only the Hindi film industry was able to support films that contained elements of all 17 genres reported by the website, including such expensive genres as animation, sci-fi, and war.⁵ In the fifth and sixth largest language-related industries – Bengali and Marathi – minimal to no elements of an expensive genre like action were found, while a comparatively inexpensive genre such as drama was predominant by comparison to the situation in the other four languages.

These economic differences sometimes fuel struggles for the control of exhibition venues. The travails of the Kannada-language film industry show that some audiences in Karnataka (which has many speakers of other languages apart from the local Kannada) were favorable to watching films in other languages than Kannada. The Kannada-language film industry attempted to create a preferential system of exhibition, whereby films produced in other languages would have reduced access to theaters, to the benefit of Kannada films. This led to strikes on the part of exhibitors, who – naturally – were more interested in full houses than in preserving the language or ethnic chauvinism of the state in which they were showing a film (Sharma, 2004). The resulting controversy received wide attention in the press.

Language is thus a powerful economic force that shapes the structure of Indian film production, and linguistic population size plays a role in deciding the moment when a language film industry came into being, the size of film production, the size of production budgets, the size of film exports, and the variety of genre elements in films made in a particular language. The next section briefly outlines the political economy perspective before proceeding to apply it to the study of Indian film audiences.

Research on Indian Film Audiences

Scholars engaged in audience studies have advocated the benefits of foregrounding such investigations against the context of audiences' media use. Pendakur (1993) points to the contributions made by Clifford Geertz, Pierre Bourdieu, and Marshall Sahlins to the "effort on the part of cultural anthropologists to synthesize the concerns of political economy with a more sophisticated ethnographic practice on interpretive lines" (p. 86).

Even if a political economy perspective is not explicitly advocated, the stress on historical and social context reveals this viewpoint. For instance, Parameswaran (2004) proposes that "audience studies must stress the relational web of porous social formations within which the media constitute viewers' identities" (p. 316) and the importance of "deep contextualization of audience activity" (see also Hall, 1980; Morley, 1986; Gibson, 2000, cited in Parameswaran, 2004, p. 318). Ang (1996) advances "radically historicized and socially contextualized analyses of the processes that shape readers' identities" (cited in Parameswaran, 2004, p. 318). Understanding the context of media use helps to take a more critical stance and guard against ethnographic studies that celebrate active and resistant audience members, studies that may ironically end up aligning their goals with existing dominant and hegemonic structures such as the corporate media industry (Ang, 1996). Meers (2001) advocates the use of "critical ethnography" to offer a "critical counterweight to the industry" (p. 140) in film audience studies, emphasizing the social and political context of media consumption that Moore (1996) favors. In Europe, such an approach plays an important role, especially given the strategic use of research in the creation of public policy with regard to films (Meers, 2001).

Emphasizing the historical approach to film audience reception studies, Allen (1990) observes that four components need to be considered: (1) exhibition, that is, "the institutional and economic dimensions of exhibition" (p. 349); (2) audience demographics and social meanings of filmgoing in the tradition of Radway (1985) and Ang (1996); (3) performance, that is, "the immediate social, sensory, performative context of reception" (Allen, 1990, p. 352); and (4) activation, that is, "how particular audience groups make or do not make sense, [*sic*] relevance, and pleasure out of particular moments of reception" (pp. 353–354). Allen cautions that assembling the data related to activation becomes worthwhile only when we pay attention to "what these data might suggest about the underlying structures of reception, their interaction, variability, modification over time or resistance to change" (*ibid.*), which comes very close to the political economy perspective's core interest of social change, even if it is not explicitly stated. He illustrates this with the example of interviews with black filmgoers of the 1920s and 1930s that reveal the key role played by cinema theaters in the community's cultural life.

Since audiences' reception of particular media is deeply interconnected with their economic and social contexts and the range of media texts they consume, the

theories that inform audience research should account for these factors (Livingstone, 1998). The importance of combining a big picture perspective with a closer view is supported by Alasuutari, who notes that,

Compared with anthropologists, who often have a cultural distance that enables them to see the forest for the trees, we have the disadvantage of being insiders. That is why we have to work hard, develop theoretical perspectives and methods that will better enable us to take distance, to see the bigger picture and ourselves in it too. (Alasuutari, 1999, p. 332)

The synergy between the political economy perspective and audience ethnography arises from the complementary nature of the observer's position in the two approaches; in other words, while the political economy approach examines the context within which culture is produced and consumed, ethnographic researchers take a participant observer position that is "emic," in other words that of the culture being studied, and not that of an outsider (Meehan, 2000). Such differences in positions make it evident that, when taken together, the two approaches lead us to a fuller understanding of the phenomenon.

Meehan (2000) illustrates the new understanding that a political economy approach can bring to audience ethnography, and she does so by using the example of Star Trek fans. She notes that fans are generally portrayed negatively both in news media and in entertainment media. They are presented as "fools" in the former and as "sexually unattractive fools" in the latter. She also notes that ethnographic studies of fandom reveal that these fans "feel scorned" by the treatment meted out to them by the copyright owners. Meehan uses the political economy approach to contextualize Star Trek fandom within the appropriation of leisure time by oligopolistic American media corporations operating within a capitalist system.

While fans represent a steady revenue stream for the corporation issuing the media product, additional revenue growth for the corporation comes not from fans, but from "mundanes" – that is, non-fans. Fans continue to be loyal consumers no matter what the corporation's behavior is toward them. However, through their various activities, fans threaten the accepted notion that media are "mere" entertainment and therefore must be contained, and this leads to the unflattering portrayal and the ridicule of fans in news and entertainment media. Thus, while the emic position of the ethnographer reveals the fans' unhappiness with the treatment they receive at the hands of corporations, the analytical approach used in political economy helps us theorize *why* they receive such treatment.

In India, film consumption is observed to take place amidst low-quality transport and energy infrastructure, and the film industry used to be subject to heavy taxation at the time of exhibition (Pendakur, 1990). The taxation on exhibition has led to some interesting effects, not observed elsewhere. In a startling contrast to Meehan's (2000) findings on the undermining of Star Trek fans in the American media, Srinivas (1996) observes in his study of the fans of Chiranjeevi, the Telugu filmstar, that fan associa-

tions were funded and cultivated by studios in Andhra Pradesh, India. He argues that, in an attempt to minimize distributor losses in the face of taxation that was independent of the number of tickets sold, distributors needed theaters to fill to more than 50%. Having dedicated fans meant having crowds on the opening day as well as repeat viewers. Fans in India thus serve an important economic function and are courted by the film industry.

Linguistic considerations influence not only how audiences consume media, but also how they choose to talk about and justify their audience consumption. Although this chapter is concerned with film audiences, a ready illustration of the importance of language for Indian media consumers is found in Parameswaran's (1999) ethnography of middle-class women's English-language romance reading in Hyderabad. Parameswaran contextualizes the importance of English-language skills in postcolonial India by delving into the historical role of English in India, where it has become the language of the power and business elites. She found that Indian romance readers had an instrumental view of English-language romance novels as tools that would improve their language skills, and therefore they expressed a preference for reading novels over watching television in regional Indian languages.

Preliminary research on film audiences shows that linguistic considerations also affect the economic structure of Indian film production in three main ways. First, films in the local language hold great attraction for particular sections of the local viewing audience. Srinivas' ethnographic investigation of film audiences in Bangalore found that, sometimes, lower-income and lower- to middle-income viewers were willing to pay more for the more expensive seats in the cinema theaters to watch regional language movies. As she observes, "[f]or such movies, *even* lower-income viewers are prepared to pay balcony rates and *even* 'black market' rates" (Srinivas, 2002, p. 163, *italics mine*).

In recent years there has been a spate of films in a regional dialect – Bhojpurī – despite Hindi being the main language spoken in northern states such as Uttar Pradesh and Bihar. The rise of Bhojpurī cinema in the Hindi heartland of eastern Uttar Pradesh and of Bihar can be traced, among other factors, to changing language equations in those regions (Tripathy, 2007). These changes occurred because of migration and the political consolidation of caste groups, which led to the production of cassettes and compact discs (CDs) of folk music that were popular with migrants seeking to escape the economic stagnation in these regions; and inexpensive films soon followed music albums (*ibid.*). In an observation that serves to underline the emotional connection that language creates between the audiences and media texts, Tripathy notes that, "[i]n a very significant sense, while Hindi has found a secure place in the lives of the masses in urban and rural India, it still lacks the intimacy of dreams that the vernaculars can provide" (p. 155).

The dubbing of films is practiced to a small extent in a few of the larger linguistic markets. When imported films are dubbed into Indian languages, culturally dissimilar materials are made culturally closer through what S. V. Srinivas (2003) calls "adding nativity." In his study of the circulation of Telugu-dubbed Hong Kong action

films in Andhra Pradesh, he observes that, through the process of language dubbing, “[t]he characters not only spoke *in* Telugu but they also spoke *like* characters in Telugu films; indeed, Hong Kong films were brought closer to Telugu films than ever before” (p. 55).

However, the importance of this cultural connection is mediated by the scale of the media production. Economic models of the international trade in film and television hold that, while audiences prefer media products that are closer to their own culture, they also prefer media products with larger production investments (Hoskins & Mirus, 1988; Waterman, 1988; Wildman & Siwek, 1988). This leads us to a second observation concerning the relationship between language and the economic structure of Indian film production. Expensive productions in languages other than the viewers’ mother tongue sometimes attract audiences. Sharma (2004) reports how audiences who lived near the Andhra Pradesh border but within the state of Karnataka, which had imposed a moratorium on the exhibition of films that were not in the Kannada language, actually travelled across the border into Andhra Pradesh to watch the Telugu films of their choice.

Third, the language of the film determines the site of viewing and therefore the extent of revenues that can be earned by that film. Gita Viswanath (2007), in an ethnographic investigation of film viewing practices in Bangalore, finds that young, mostly male filmgoers watch English-language films in the exclusive space of the “multiplex cinema generally housed in large, brightly lit and colorfully decorated malls,” where “the appearance of a Brad Pitt on a multiplex screen is received in a passive, suave and sophisticated manner” (p. 3290). While English films may be exhibited in multiplex cinemas, where the tickets are more expensive than in single-screen cinemas, they cater to much smaller audiences. Hollywood films in general have been observed to capture only 5–7% of the Indian market in terms of revenues, according to industry estimates (FICCI, 2007).

However, these filmgoers also report that they prefer to go to older single-screen theaters when they want to watch a film in a regional language, because “the clientele is more representative of the Indian demographics than in the multiplexes” (p. 3290) – in other words, the lower classes are also represented. Viswanath theorizes that these young people are able to “make unproblematic shifts in identities” when they switch between the two very different sites of film viewing. The reason for the move into the less exclusive space is this:

They claimed that watching the reaction of the stalls spectators from the balcony was part of their own enjoyment of the film experience. The space of the single screen theatre is more familiar, less intimidating and more tolerant of spontaneous behaviour. The viewing experience is more participatory, boisterous and intense. The appearance on screen of their favourite stars like Raj Kumar, Chiranjeevi or Upendra would be cause not merely for hooting, whistling, etc, but at times extreme adulatory forms of fan behaviour such as throwing coins on the screen or performing an “aarti” when the hero appears. (Viswanath, 2007, p. 3290)

Viswanath contextualizes Indian film viewing in multiplexes as arising from two related historical trends, the first of which is the change in the structure of film exhibition stemming from the decline of Indian theatrical audiences in the 1980s due to the rise of television. This phenomenon led to a reduction in the numbers of single-screen cinemas and to the birth of multiplexes. Further, the growth in the Indian economy – which was due to changes in government policy favoring liberalization – led to increases in the income of middle-class Indians employed in the service sector of the Indian economy. Although Viswanath does not claim to take a political economy perspective, the context and analysis she presents is in line with the political economy approach outlined in an earlier section of this paper, which calls for an examination of history and social change. From the perspective of our understanding of the role of linguistic diversity as a part of Indian society, we can argue that the shifts in identity that Viswanath reports are related to the complex language repertoires that Laitin (1989) described.

As expected, gender and class mediate both the linguistic diversity and the reception of films in India. The gendered nature of filmgoing in India is revealed in the ethnographic studies of Dickey (1993) and Derne (2000). Derne observes that in the north Indian town of Dehradun, women accounted for approximately only a quarter of the audience in the better cinemas in the town, and very few attended the cheapest cinema, which was more popular with the men. He attributes the low attendance of women at cinema theaters to the pressures of household responsibilities and to “the need to be respectable.” The economic inequalities that shape media consumption in India, referred to earlier in the chapter’s introduction, are also reported in these ethnographic studies of Indian film audiences. The work of Sara Dickey (1993), Steve Derne (2000), and S. V. Srinivas (1996, 2003) remains exceptional in that these scholars are among the few who have examined lower-income film audiences. Dickey’s (1997) ethnographic investigation in a small town in Tamil Nadu showed that Tamil film fans typically belong to the lower socioeconomic classes in Tamil Nadu, and through the social welfare activities of their fan clubs they distinguish themselves from the “poor.”

Class mediates the language of film consumption. For instance, Steve Derne (2000) observes that, throughout the duration of his study, only one Hollywood film played in the north Indian town of Benares, in 1987, and the film was not appreciated by the audience; however, Derne does report that audiences in the more cosmopolitan city of Bangalore enjoyed Hollywood films. Similarly, Dickey (1993) reports that many filmgoers belonging to the lower classes in Madurai, a medium-sized town in Tamil Nadu, had never seen a single Hindi film. In a continuation of this trend, urban middle-class Marathi- and Gujarathi-speaking audiences in Mumbai preferred to watch Hindi films and to consume English print media (Desai & Agrawal, 2009). Class also affects the themes that are popular in films. Rao’s (2007) ethnography of lower-middle-class film audiences in a small town in Punjab reveals a growing alienation from the globalized Hindi-language films, especially those aimed at wealthy diaspora audiences.

Implications for Studies of Film Audiences in India

The historical, economic, and research contexts outlined in the previous sections of this chapter point toward a robust future agenda for research on film audiences in India. In this section I raise questions and concerns that can perhaps direct the trajectory of future work. The historical importance of languages in India shows us how, despite the consecutive presence of Persian first, then of English and Hindi, regional languages continue to thrive in India. Depending on where an Indian citizen is living, he/she may use as many as four different languages. Linguistic diversity is a powerful economic force in India that shapes, among other things, the availability and use of films by audiences.

The economics of the linguistic market size for films reveals that audiences in larger linguistic markets have access to more films in their own language, whether through local production or through language dubbing; these films are made with bigger budgets and with a greater variety of genre elements. Film audiences in states with larger populations speaking the same language therefore have access to a different set of films than film audiences in states with smaller linguistic populations. While Hindi film audiences have access to (elements of) many genres in Hindi films, audiences of films in other languages may not have access to (elements of) as many genres. For instance, Hindi films contain elements of the action genre, while films in other languages are unable to afford elements of this expensive genre. Where do such audiences turn to satisfy their demand for action films, and what are the implications of this quest? Is it possible that, rather than turning to the more expensive Hollywood action films, Telugu distributors turned to the cheaper action films coming out of Hong Kong? Srinivas (2003) writes of the immense popularity of the Hong Kong action film in Andhra Pradesh and of the spread of martial arts schools in the state. Where do audiences in other states turn for their action films?

Past research on mass media effects and processes reveals the existence of knowledge gaps between media audiences with greater access and ones with reduced access. What kinds of knowledge gaps exist between Hindi film audiences and audiences of films with fewer speakers, say Konkani or Sindhi?

Media economics models of the trade in media products lead us to expect that films from larger linguistic industries travel better than films from smaller linguistic film industries. Films produced in Hindi, Tamil, and Telugu are also exported to markets outside India to a greater extent than films produced in languages with fewer speakers. How does this affect the diaspora audiences in different parts of the world? How do members of the Tamil diaspora choose films from India, in other words do they choose Tamil films, or are they open to Hindi films or films in other Indian languages? How do class and gender identities affect these complicated choices?

Within India, how do the patterns of flows in vernacular-language films affect audience responses and domestic markets? Some researchers hold that Hindi-language

cinema is popular throughout India, while others have found no evidence of this, especially with lower-income audiences. How do audience members' class and gender identities intersect with the consumption of films in languages other than one's own mother tongue? And how do these viewing patterns change with the availability of technologies such as digital versatile discs (DVDs), versatile compact discs (VCDs), and television? Given the various constraints imposed on women in India, do women in some parts of the country have access to certain genres of films that others don't have access to because of the languages that they speak?

Research also shows that media products from markets that are culturally closer to each other travel better than ones from culturally dissimilar markets. On the basis of this we would expect the four southern states to have a higher trade in each other's films than in films from other parts of the country. To what extent is this true? How do taxation and other forms of government regulation and intervention – such as support for production infrastructure – affect this balance? Is this kind of support borne out in audience/citizen endorsement?

With the gains made by India's services sector in the current global economy, English-language acquisition has increased as the preferred route for occupational and upward social mobility. How has this affected the choices that Indian filmgoers make? How are Hollywood films altered when they are dubbed into Indian languages? TV channels in India that screen Hollywood films routinely carry subtitles in English, because the English dialogues spoken by the actors have an American accent, which is unfamiliar to many English-speaking Indians. How does this affect Indian filmgoers like those interviewed in Desai and Agrawal's (2009) study, who watched Hindi films but read English newspapers? What are the choices made by young Indians who have come of age in a liberalized India and have grown up on television channels that are full of imported children's programming dubbed into their local language? What films do they select to watch?

The questions on Indian domestic and diaspora film audiences that this chapter's conclusion raise illuminate the ways in which the political economy approach to film industries can generate a robust agenda for audience research in India's rapidly changing landscape of film production and consumption. Political economy and audience ethnography in India's diverse and pluralistic multilingual media markets can enrich each other. If political economy directs audience studies to consider the influence of regulations and policies and the economics of production and distribution on film viewers' taste cultures, the messy realities and contradictions uncovered in audience ethnography can challenge political economy to incorporate social and cultural theories in order to challenge or modify its tendencies toward economic determinism. When political economy and audience ethnography approaches speak to each other, we increase our opportunities to draw rich insights into the various forces that govern the diverse multilingual practices of film viewing in India – a country that produces the largest number of films in the world.

NOTES

- 1 Compiled from statistics recorded by the Central Board of Film Certification reported in Rajadhyaksha and Willemen (1999) for the years 1931–1981 and from annual reports of the Central Board of Film Certification (CBFC), Mumbai, India, for the years 1982–2005.
- 2 Film productions in these 11 languages, taken together, constituted 97% of Indian-language film productions in the 75-year period from 1931 to 2005.
- 3 Ministry of Statistics and Programme Implementation, 2004. Statement: Gross state domestic product at constant prices. Retrieved Oct 30, 2007, from http://mospi.nic.in/7_gsdp_const_9394ser.htm
- 4 In Malaysia, owing perhaps to the large proportion of audiences of Tamil origin, Tamil films are more popular than Hindi films out of the films imported from India. Schiffman (1995) reports that 85% of the 1.5 million Indians in Malaysia are of Tamil origin. I found that Tamil films constituted 71% and Hindi films constituted 27% of Indian films featuring on the popularity charts.
- 5 The 17 genre elements are: action, adventure, animation, comedy, crime, drama, family, fantasy, history, horror, musical, mystery, romance, sci-fi, sport, thriller, and war.

Watching Telenovelas in Brazil

Mediating the Everyday

Antonio C. La Pastina

ABSTRACT

Telenovelas in Brazil are, undisputedly, still the most popular form of entertainment. Even after almost 50 years of daily broadcasting and radical changes in media technologies that challenged the dominant media producers, a Globo network telenovela can still gather over 30% of the audience on a daily basis. Why have telenovelas managed to capture and hold the imagination of so many viewers in that country? On the basis of a range of qualitative reception and ethnographic studies that began to be produced both in Brazil and abroad in the early 1980s, and on the basis of my own ethnographic work, it seems that Brazilians have relied on telenovelas to maintain a sense of connection to the nation, to grasp and understand new urban middle-class trends, and to question normative ideas and structures in their day-to-day lives. On a less optimistic note, this chapter also argues that telenovelas, unintentionally, have reinforced a rural–urban divide in Brazil.

Augusto, a politician in his mid-thirties, liked television and telenovelas a lot. He never saw his desire to watch telenovelas as a threat to his manhood or his status in Macambira, a small rural community in northeast Brazil. Sometimes he watched television at his place, but mostly he would go to the house of a friend or a political supporter, since his wife worked the night shift as a nurse in a neighboring town. For

Augusto, *The Cattle King* (1996–1997), a telenovela with a landowner as the hero and a landless peasant as the target of his love, provided good examples for Brazil. For instance Augusto saw pedagogic potential in Leia, the hero's adulterous wife.

At the beginning of the telenovela Leia was a well-married woman. After a while she left her husband for another man. It was a big conflict. But as time progressed, she returned home, saw her ex-husband and they talked. He accepted her. So, the television is showing that even if the woman leaves the man, it is not necessary to keep fighting, wanting to hit the wife. The telenovela showed to Brazil that it can happen within the Brazilian reality. It can happen because the telenovela is showing it. (Ethnographic interview with Augusto, December 23, 1996)

Augusto was arguing that telenovelas can show behaviors that are “modern” and urban, yet not in conflict with the values of Brazilians. For him, women in telenovelas, and consequently in larger metropolitan centers, were already liberated, and hence they were engaging in practices that were still perceived to be disreputable in a small town such as Macambira. He believed that women, even in rural communities, had gained more freedom and that people were more accepting. He believed that telenovelas had helped in part to usher in this process of change. This one-decade-and-a-half-old quote underlines the discussion that will follow in this chapter. Augusto argued for the relevance of telenovelas in Brazilian society and, indirectly, he explained why these melodramatic texts have aroused so much attention not only among viewers, but also among academics, advertisers, and social activists. Even after more than 50 years of daily broadcasting, of changes in delivery technologies, and of increasing fragmentation of the audience through a larger number of open-air networks, cable, satellite, and internet providers, a Globo network telenovela still attracts over 30% of the total audience on most evenings in Brazil. Why and how have telenovelas managed to capture and hold the imagination of so many viewers in Brazil for so long?

This chapter discusses telenovelas' audiences in Brazil and offers a case study of rural viewers in order to document the ways in which audiences make connections (La Pastina, 1999, 2005) between popular culture narratives and the circumstances of everyday life. On the basis of a range of qualitative reception and ethnographic studies that began to be produced both in Brazil and abroad in the early 1980s (see McAnany & La Pastina, 1994 and Jacks, 2008 for reviews of the audience research in Brazil), it seems that Brazilians have relied on telenovelas to forge their national identities, grasp new urban middle class trends, and interrogate the concerns of everyday life. The first section of the chapter, which serves as a background for the case study that follows, provides an overview of the social and economic contours of telenovelas. I begin this section by outlining telenovelas' classification as a women's genre and then summarize audience research on telenovelas; this is followed by a discussion of the role of product placement and social marketing in the creation of telenovelas. The next section of the chapter presents an overview of a case study in

rural Brazil that takes up the themes presented in the first section. The final section concludes by identifying some promising areas for future research.

Every Night on Prime Time

Brazilians, millions of them, tune in Monday to Saturday to watch the drama and comedy of various telenovelas, following a narrative for several months – sometimes six, if the ratings are low, sometimes up to nine or ten, if the plot grabs the national imagination. *To Live One's Life*, the 2010 program broadcast in the prime-time spot of the leading network, Globo, attracted both criticism and praise. It is the story of a gorgeous and clever young model who, with several other models, has a bus accident on the way back from a fashion show. She becomes disabled. The drama of romance, love, and betrayal features many characters, including the model's handsome millionaire father, and acts as a foil for her recovery and decision to live her life fully. This strongly prosocial characteristic has led some viewers to complain of being tired of seeing a story about women in wheelchairs, yet many audience members are fascinated with the heroine's life and her strategies for survival. Her experiences have prompted news stories about similar events in the real lives of wheelchair-bound individuals from different parts of Brazil. The socially conscious nature of this drama, coupled in this case with the provision of a real-life story of a disabled person at the end of each episode, is one of the many trademarks of the Brazilian telenovela.

Unlike its counterparts in other Latin American nations, the Brazilian telenovela has been developing, since the late 1960s, into a unique local genre incorporating the voice, characteristics, and preoccupations of the Brazilian urban middle class. By the early 1970s the Globo network had invested heavily in production values; for instance it increased the use of external shoots, which had been previously avoided due to cost. The network also promoted a modernization of the telenovela's themes, including current issues and texts written by Brazilian writers. Through this process Globo created what it termed, in its own publicity material, the *padrão globo de qualidade* (Globo Standard of Quality) (Straubhaar, 1982; Lopez, 1991). These changes in style led Brazilian telenovelas to become more dynamic and more closely associated with current events in the life of the nation. According to Mattelart and Mattelart (1990), Brazilian telenovelas are an "open work" or an "open genre." During production, the telenovela's creators receive direct and indirect input from viewers and fans, theatrical productions, commercials, elite and popular press, institutional networks, audience and marketing research organizations, and other social forces in society such as the Catholic church, the government, and activist groups (Hamburger, 1993).

For several writers (Straubhaar, 1982; Ortiz, Borelli, & Ramos, 1988; Lopez, 1995), the landmark telenovela that started the redefinition of the genre in Brazil was *Beto Rockfeller*, which was aired by Rede Tupy in 1968–1969. *Beto Rockfeller* escaped the traditional molds of the genre, presenting a telenovela in which artificial dramatic

attitudes were abandoned and the use of colloquial dialogue broke with previous patterns of literary speech. But not only the language changed; the dramatic structure, narrative strategies, and production values were also modified.

[In *Beto Rockfeller*] the reigning manichaeism became an integral part of the protagonist's character; the anti-hero took front stage, which up to that point had been occupied by firm and sensible characters, absolutely honest and capable of any gesture to save the heroine from adversity. [*Beto Rockfeller*] tried to get closer to the common people; to have good and bad attitudes much in the same way as they happen in one's life. (Fernandes, 1994; my translation)

Beto Rockfeller was the story of a middle-class young man who worked for a shoe store but used his charm and wit to pass himself as a millionaire – hence his last name. To keep his secret and maintain high social status, he had to engage in many less than honest activities. The telenovela reached very high audience ratings, leading the network to stretch it to almost 13 months (Fernandes, 1994). Globo – which up to that point had cultivated a very traditional style of telenovela, locating them in far away places with exotic settings and plots – saw the audience interest in *Beto Rockfeller* and championed this new strategy, placing the contemporary everyday life of urban Brazil front and center in their new telenovelas. In the decade that followed, Globo became the leading network of the nation, barely allowing competing stations to gain a fraction of the audience. In this process it reshaped the genre. Intentionally or not, Globo transformed the Brazilian telenovela into a forum for the discussion of Brazilian reality.

While Globo benefited directly from the dictatorship in Brazil – it had direct support from the government (Lima, 1988) – it also benefited indirectly from the 1968 imposition of censorship in Brazil. The institutional Act 5 (AI-5) heavily restricted the ability of many intellectuals, and particularly playwrights, to work in the theater and in the cinema. Writers such as Dias Gomes, Janet Clair, Benedito Ruy Barbosa, Silvio de Abreu, or Plino Marcos began to write telenovela screenplays. These writers were concerned with the urban reality and social preoccupations they observed, particularly in Rio de Janeiro, where the Globo network was located. They used metaphorical lenses to examine national and rural issues, tapping into the popular imaginary and into the patriarchal, patronage-based culture of northeast Brazil to subtly question the military dictatorship. The 1970s were years of military dictatorship, and Globo was clearly working in tandem with the regime to promote the nationalization of culture (Mattos, 1980). But the anomaly of having telenovela writers with anti-establishment credentials begs the question of why the regime was so lenient with this budding industry.

The writers were aware of the censorship laws and relied on romance to present the everyday; but, even so, they sometimes had their stories cut or censored. Additionally, the Globo network supported and was supported by the regime, becoming its unofficial voice with its 8 o'clock newscast that presented the government's

“reality” every night (Lima, 1988; Porto, 2007). The newscast benefited from the popularity of the telenovelas, which sandwiched that half-hour news show. This, I’d like to argue, also helped ensure that telenovelas were tolerated by the regime. Finally, most relevant to the present argument was a widespread misconception that telenovelas were women’s products, consumed only by women and consequently of little relevance (Hamburger, 1999).

Women’s Genre

This last point is rooted in the origin of the genre in the early US radio soap operas, which positioned television serial fiction as a women’s genre. Hamburger (1999), in her ethnographic study of lay theories of telenovela audiences, demonstrates how writers, advertisers, producers, and Globo management staff bought into this early view that the telenovela was a women’s genre. Marketeers consequently focused all their efforts on a female target audience, overlooking the evidence that men, too, were consuming these texts voraciously, even if they were reluctant to be openly described as viewers. Since at least the mid-1980s, the audience has been almost 40% male (Ortiz et al., 1988). This perception of telenovelas as gendered, as a female text, also relates to the construction of femininity in Brazilian culture and to the distinct spaces that were traditionally defined as masculine (the street) and feminine (the home), as discussed by Roberto da Matta (1985).

Perceptions of the telenovela as a women’s genre influenced most of the research produced in Brazil for the following decades. Studies by Leal (1988), Vink (1988), Prado (1987), Jacks (1993), Tufte (1995), and others worked steadily to build knowledge about women viewers, relying primarily on reception theories from the Birmingham School. Later works – such as Tufte (2000) and Lopes, Borelli, & Resende (2002) – used the notion of mediations, developed in Latin America by writers such as Guillermo Orozco in Mexico and Jesus Martín-Barbero in Colombia. Martín-Barbero (1993) proposes that, instead of studying the relation between viewers and texts from “the logic of production and reception [. . .] we [should] start with the mediations where the social materialization and the cultural expression of television are delimited and configured” (p. 215). These mediations are

[the] place from where one can understand the interaction between the space of production and reception: that which is produced on television does not necessarily relate uniquely to the requirements of the industrial system [. . .] but also to the demands of the cultural web and to the [audience’s] ways of seeing. (Martín-Barbero & Muñoz, 1992, p. 20; my translation)

With the mediations project, Martín-Barbero is attempting to decenter the media, arguing that they are losing their “specificity and becoming an integral part of the

economic, cultural and political system” (Richeri’s study, as cited in Martín-Barbero, 1993). This “abdication of mediacentrism” is a result of social movements that push the media to be integral to the economic system. Mediations are then the “structures encrusted in social practices and the everyday” (Lopes et al., 2002, p. 39; my translation). Therefore the mediations become a central sphere where media functions and interpretations can be understood in relation to everyday life, because “[they] produce and reproduce the social signification, thereby creating a *sphere* which makes the understanding of the interactions between production and reception possible” (Tufte, 2000, p. 21).

Leal’s (1988) landmark study on upper-class women’s and their maids’ readings of the telenovela *Summer Sun* became key to understanding the way these viewers dealt with these texts in their everyday lives. Class became a marker for how the telenovela was interpreted, but also for how gender was talked about. The wealthier and more educated women attempted to distance themselves from the narrative and discussed the genre and the text decoupled from their own everyday lived experiences, while working-class women engaged with the narratives at a personal level, talking about their lives and the lives of the characters in relation to each other and in interaction with each other. Upon its publication in 1988, Leal’s work became a model for the study of telenovelas in Brazil, creating a school based on reception theory and cultural studies.

The research of Lins da Silva (1985) and Tufte (1995) also suggests similar patterns of critical distance in the decoding of television messages. Unlike Leal’s, however, their research shows that this critical stance may be due to political consciousness and the engagement in political or community-based activities rather than simply reflecting class. Lins da Silva (1985) looked at the way workers decode news messages from *Jornal Nacional*, the nightly newscast aired by Globo Television. He collected his data from two working-class neighborhoods in Brazil: Paçara, on the coast of São Paulo state, and Lagoa Seca, in Rio Grande do Norte. Prior to starting the data collection, this researcher used an open-ended instrument to survey 250 people in both communities. Most of these people attended meetings later on and discussed the programming of the previous week, participating in some kind of community activity.

On the basis of his findings, Lins da Silva concludes that other sources, such as church, unions, political parties, radio, newspapers, and interpersonal contact offer the respondents information that often contradicts the one provided by television. His findings showed that (a) other sources were taken more seriously and may have been more influential than television; (b) previous knowledge of the issues discussed had an important role in aiding the decoding of messages; (c) news from abroad, which participants normally had no knowledge of, was taken at face value when aired on *Jornal Nacional*; and (d) local and national news, however, tended to be challenged. These findings, according to Lins da Silva, show that members of a community can make a critical reading of the information supplied by television, as long as they have access to other sources of information.

Telenovela Audience Research

In Brazilian telenovela research, one subject position has generally been privileged, be it that of class (Leal, 1988), political engagement (Sluyter-Beltrão, 1993), or gender (Prado, 1987; Tufte, 1995, 2000). Concentrating on one subject position alone reduces the possibilities for more textured analyses of audience reception. For each audience member, his or her identity might be multifaceted and several of his or her subjectivities may be engaged in the process of watching a single television program.

In contrast, Jacks (1993) focused on how regional culture mediates audience interpretations, consequently addressing issues of cultural similarities/proximities and becoming one of the first to rely on Martín-Barbero's early theorizing of mediations. Independently of class, viewers in Santa Maria, a mid-size town in Rio Grande do Sul, showed preference for characters presenting some of the characteristics they perceived to be inherent of the Gaúcho, natives of their home state. These viewers had already scored highly on Jack's scale of participation in traditional Gaúcho culture and were aware of local traditions and proud to engage in them. Jacks' work raises the issue of cultural proximity (Straubhaar, 1991; La Pastina & Straubhaar, 2005), another important element in the identificatory process. Cultural proximity might be recognized through visual (e.g., the landscape, dress style), verbal (e.g., regionalism, historical references), or other characteristics associated with a particular regional "culture." Tradition, pride, and honor were seen as important elements in defining a telenovela character who potentially could be cast as Gaúcho.

In her work on the potential impact of telenovelas on the emancipation of working-class women, Vink (1988) argues that product placement, "the expansive form of advertising during telenovelas, is based on the belief that identification with heroes and heroines will increase the sales of all kinds of products" (p. 236). But one of the most compelling arguments for the process of identification and use of telenovela messages comes from Vink's retelling of Alves' research (cited in Vink, 1988). In *Coração Alado* (produced in 1981), Vivian, the main female character, is raped by her brother-in-law and has to decide between abortion and having the child.

Many women confessed to the researcher's wife that they had a similar experience and that the telenovela had helped them reevaluate the decision they had made at the time. Others admitted [to] having been faced with the same dilemma, and said the doubt exhibited by the telenovela character helped them to solve their problem. The striking element is that several viewers decided to get an abortion, even though Vivian in the novela decided against it. (Vink, 1988, p. 236)

The emotional involvement provoked by scenes to which a viewer relates personally probably has a strong impact upon such a viewer's identification with telenovelas. Viewers' identification with telenovelas takes place when they find similarities between their lives and the characters' situations in the texts. The perception of difference can also lead viewers to identify with characters and

situations. The social context, genre structure, and narrative strategies, as well as the message content, can all have an impact on the identification process. There are clear examples, such as those mentioned by Leal (1988), of women using telenovela situations to approach certain issues with their partners. For several viewers, the process of identification may allow them to experience vicariously the lives of people in other realities, through which they might rethink their own realities and slowly articulate changes in their daily lives. Most of the studies conducted on telenovela viewers have focused on one particular telenovela – or two, in the case of Prado (1987); but they all make reference to other telenovelas mentioned by viewers (Jacks, 2008; McAnany & La Pastina, 1994). Tufte (1995) tried to expand the focus from one telenovela to many by analyzing the case of an actress, Regina Duarte, as a star. However, from the selection of the media texts used in these research endeavors it becomes clear that the issues perceived and debated by viewers are directly related to the narratives within the text. Sluyter-Beltrão's (1993) viewers talked about political issues not only because her interviewees were more politicized, but also because the text she was using represented a clear parody of the Brazilian political system. This political subtext in the telenovela was reinforced by the elite news media that covered the telenovela as a political event. Leal's (1988) women could discuss their relationships more easily when characters in the telenovela were also discussing their own emotional relationships. Tufte's (1995) respondents could discuss their struggle and the feelings of being ridiculed or rejected due to their social class or race because the leading character in the telenovela was going through similar situations. La Pastina's (2004a) viewers engaged in political readings because *The Cattle King* dealt directly with land reform and political corruption. Telenovela themes offer a vocabulary and a set of references for the discussion of specific issues. But they also work in a sedimentary manner, forming layers of meanings, themes, and vocabularies. Many times the actors' roles are quite similar to previous roles from earlier telenovelas, and characters in other telenovelas may go through similar situations. Tufte (1995) cites the example of a *mulatta* woman recollecting the character of a black architect, played by Zezé Motta in the telenovela *Corpo a corpo* (1984–1985), who endured racial discrimination. Tufte's respondent talked about this character from her repertoire of telenovela memories to explain her views on the problem of discrimination in the 1990 telenovela they were then watching, *Rainha da Sucata*.

Prado's (1987) fieldwork in Cunha, a small town in São Paulo state, demonstrates the importance of social, historical, and political contexts in explaining women's readings of female characters in two telenovelas. One important issue raised by Prado's study is that messages encoded in the text will raise certain topics for viewers; so for instance a rural telenovela might have as a background issue the matter of land ownership; while an urban telenovela might raise issues regarding race or sexuality. There are certain limitations inherent in the text; these are due to the genre's rules and narrative strategies, as well as to the thematic emphasis of a certain telenovela:

[Through] the issues raised by the telenovelas, the women in them reach the real women viewers. We can possibly say that the women from the telenovelas function as a mirror, representing to the real women something that these women are and that they like or dislike; or something they are not and they would like or not like to be. (Prado, 1987, p. 138; my translation)

The text has an impact on the possible kinds of identificatory positions viewers can engage in. In research conducted in a small rural village in Ceará, La Pastina (1995) demonstrated that male respondents were clearly engaged with the 1994–1995 remake of *Irmãos Coragem*, a telenovela originally aired in 1970–1971, which promoted a clearly nationalistic project. Set in a rural northeastern town, the telenovela dealt with “rivalry among colonels, banditry, horses [. . .] it was more like a movie than a telenovela,” according to Assis, one respondent. Assis felt that it was easier to identify with characters in that telenovela because he felt more comfortable with a text that resembled a film rather than a telenovela – “which is more liked by women,” he said.

It is important to look not only at the direct context (the family and the house, as discussed by Leal, 1988 and by Morley, 1986, 1992), but also at the social, political, and historical environment in which the viewing site is located. The social environment considers structures such as gender, age, and race relations and elements such as health, education, and religion. The political sphere of the viewing site includes elements such as political patronage, corruption, and the perception of the role of politicians. The historical environment includes elements such as patterns of migration, traditional forms of economic survival, and racial and class hierarchies. Meaning can be apprehended only within a social–historical context; if the process is de-historicized, then meanings assigned to a text by viewers can potentially be misinterpreted.

Telenovelas for Profit

The commercial nature of telenovela texts requires a certain exposure to and awareness of capitalist culture to enable viewers to assess the meanings of some intertextual references such as product placements (La Pastina, 2001). These texts are surrounded by commercial breaks that target a particular segment of the viewing population, depending on the time and channel on which the telenovela is broadcast, as well as on the nature of the narrative. Together with merchandising, commercial insertions in the text help create a flow of meanings that must be assessed in terms of the local reality in which the viewers are inserted.

Brazilian telenovelas, especially Globo’s, have long used product placement as a commercial strategy to increase revenues (La Pastina, 2001; Melo, 1988). Specific products are either shown or mentioned in a dialogue, within programs, in return for a negotiated fee. For example, from 1983 on, a number of telenovelas on TV Globo carried in-program propaganda for a major bank, Banco Itaú. In the telenovela *Tieta*

(1989–1990), a modern, colorful branch of the bank was frequently shown in the middle of a small, traditional northeast Brazilian town. The bank branch opening was shown, and later on characters were shown doing business there, using its credit cards, and so on. Another TV Globo telenovela called *Top Model* (1990) contained a fashion show featuring the actual fashion line of a company partially owned by the daughter-in-law of Roberto Marinho, owner of the Globo network. Traditionally these product placements are tenuously related to the plot. Even though the telenovela's creative team does have some say in what will be inserted, most decisions regarding product placement are made by the marketing and advertising departments.

The goal is to make the product or concept advertised inherent to the narrative, forcing viewers to read that product or concept as a quality of the character using or manifesting it. With product placement, the networks can also circumvent legislation that limits commercials to fifteen minutes per hour, thus increasing the potential revenue per hour of production. *The Cattle King* (1996–1997) was very successful in attracting an audience that hovered around 50% of the television sets tuned in every evening. Several companies committed to advertising in this telenovela on the basis of the previous success registered by the writer, director, and leading actor in an earlier collaboration, but also on the strength of Globo's track record of delivering every evening a sizable audience with the desirable demographics.

Telenovelas for a Cause

The telenovela writer, on the basis of his or her personal agenda and in consultation with the network's office for social responsibility, develops social messages that are termed "social merchandising"; this is not the case in product placement (La Pastina, Patel, & Schiavo, 2003). These issues might include missing children (Gloria Perez's *Explode coração*, 1995), racial equality (*Próxima vítima*, 1994; *America*, 2005; *Viver a vida*, 2010), land reform and political integrity (Benedito Ruy Barbosa's *The Cattle King*, 1996–1997), and disability (*Viver a vida*, 2010) – to mention just a few. Some telenovelas, however, incorporate prosocial elements that are not inherently part of the narrative, such as messages about the importance of using condoms (*Pátria minha*, 1993) or specific health campaigns like promoting awareness of breast cancer (*História de amor*, 1996). This long-term use of telenovelas for social causes has trained viewers to read those insertions as parts of the narrative, and in some cases to evaluate the quality of the telenovela on the basis of these socially conscious messages..

Benedito Ruy Barbosa's first rural telenovela, aired in 1971–1972, was also the first Brazilian telenovela to use the genre for educational purposes. In *Meu pedacinho de chão* (*My Little Piece of Land*) he presented land conflict, but unhappy censors excised about 12 scenes. For all this censoring, most of the message was still communicated. The narrative was set in a small village, and Barbosa used that setting to discuss problems of rural life, promoting hygiene and agricultural information (Fernandes, 1994). *Meu pedacinho de chão* was co-produced by TV Cultura (the public television

station in the state of São Paulo) and Globo. The adaptations of national authors and the educational content of some Globo products, such as *Meu pedacinho de chão* and the children's show *Sítio do pica-pau amarelo* (*The Yellow Woodpecker's Ranch*), were symbolic of this strategy of promoting a national culture and of educating viewers. Barbosa believes that telenovelas are privileged sites for discussing the problems and conflicts of the nation and for promoting awareness and ultimately change. In *The Cattle King* he pushed his political agenda to a new limit through a subplot devoted to land invasion and the politics of agrarian reform in Brazil. In the next section this telenovela will be the point of departure in a discussion of reception in a rural town in Brazil.

Watching TV in Macambira: A Case Study of Rural Viewers

The residents of Macambira, a small rural community in Brazil where I have conducted research since the mid-1990s, remain avid consumers of telenovelas. I will discuss the interpretation of one telenovela and in this process I will point to the challenges of audience work, to the process of engagement that occurs between viewers and texts, and to how the complexity of the narrative is central for the interpretative processes to unfold.

In 1996–1997 I followed *The Cattle King* in this rural community. During the 10 months of broadcasting I watched this and other telenovelas in the company of local residents and I conducted ethnographic interviews, participant observation, and in-depth interviews. But, above all, as a long-term ethnographer, I became immersed in the everyday of the community and my questioning about telenovela(s) was just another topic of conversation among many I broached in the groups of individuals I joined, socializing on sidewalks around town.

The Cattle King was a complex narrative by Benedito Ruy Barbosa that, in spite of being melodramatic and having love triangles frustrated by family histories, rivalries, and staunch enemies clearly marked as villains, discussed serious issues that confronted Brazilian society at the time. The landless movement was working steadily to bring the plight of those without land to the forefront of national debate, while political corruption, a recurring problem in Brazil, was rampant in the mid-1990s. In *The Cattle King* the heroine was a landless peasant destined to win the heart of the local landowner. We discover later that the heroine, although just a peasant at an early point in the narrative, was really a very wealthy heiress who had lost her memory in a car accident – an accident in which her whole immediate family died: this is the nature of telenovela melodrama. The hero was the cattle king, the owner of enormous ranches that he surveyed by plane. But he was a good landowner, who cared about the landless; he was also the friend and political ally of an honest senator, himself incorruptible and a supporter of the landless cause.

In the complex intermingling of melodrama and social justice, adultery and premarital sex, key subplots emerged that served to bond and to destabilize the lives of

the characters. *The Cattle King* allowed viewers to engage with their own set of values and attitudes toward gender roles and sexual practices. In this process they questioned the validity of the images portrayed and their own reality. They shared their lived experiences while criticizing or praising the characters' actions and situations. The inherent genre repertoire available to viewers and the latter's familiarity with it allowed most of them, male and female alike, to participate emotionally in the narrative. In the following analysis I will demonstrate how viewers interact differently with these narrative elements, although on many occasions this happens simultaneously. This process, which I term media engagement, reflects the complexity of audience ethnography and its benefits.

The engagement between viewers/consumers and texts needs to be investigated as a process located in a broader context than the immediate site of the viewing interaction (La Pastina, 2005). I identified four stages of this engagement process: reading, interpretation, appropriation, and change. The first phase occurs when the actual reading happens, normally in the home, within a family context. The 'reading' phase is best understood in terms of a factual explanation of the narrative structure and content. The second phase occurs when the text is interpreted, which happens not only at an individual level but also through social interactions that might impose upon the text norms, values, and beliefs shared by the community. After interpretation, the third phase involves appropriation, where the issues brought up by the text and interpreted through mediating forces are used to explain one's own life or the social relations and cultural dynamics in which the reader is inserted. The processes of identification and catharsis are normally at work, and resistance also happens in this phase. The final stage in this engagement model is behavior change, which in many cases is the stage most challenging to document. This is the case even though ethnography, with its ability to develop longitudinal investigations, has the potential to observe community and social change that might be related to media presence. The four phases described here are an artificial attempt to impose an analytical framework upon an unruly process, but the framework does not assert that these stages are discrete or present in all textual engagements.

Telenovela appropriation in a small rural community such as Macambira is mediated by social talk (gossip), by knowledge of genre rules, by the viewers' cultural capital (particularly regarding urban lifestyles), by the local patriarchal culture, and by geographical isolation. Macambira's peculiarities also mediate the media consumption. Limited male employment and reliance on female labor, namely embroidery, have allowed women to gain greater independence.

Patriarchy

The questioning of local sexual mores and norms was experienced by many residents, who consumed telenovelas and other media products and saw a gap between their culture, values, and traditions and those represented on the screen (La Pastina,

2004b). It is in this sphere – between the local and the televised – that the mediations that structured viewers' interpretations of *The Cattle King* are located. Mediations are the sphere where production and reception interact, creating a space where interpretations can be understood in relation to their broad social, cultural, political, economic, and historical contexts. By raising issues of sexuality, trust, and moral norms, this telenovela fed viewers with material that, to some, resembled their own experiences. For others, it questioned the local patriarchal culture and exposed the gaps between representations of life in urban centers and their own lives in Macambira, thus reinforcing concerns over the telenovela's content.

The local patriarchal culture and its peripheral location in relation to the urban centers, as represented in the text, was a central mediating factor in the late 1990s. This telenovela's popularity was unquestioned in Macambira, even when elections were attracting most of the town's attention. Viewers followed the telenovela, asking friends and neighbors about what happened when they missed episodes and watching segments between meetings and rallies. Young and old talked about characters, used language from the telenovela, and knew about the main characters. Few residents had no information about the telenovela.

Established gender norms, attitudes, and the changing political economy of Macambira in many ways structured the levels of interaction between viewers and texts. Women's increasing economic power, due to their work as embroiderers, and the growing dependency of men on women's incomes have created a fracture in the traditional male–female domination patterns. This has allowed women to question their own and the men's roles in the household and community. The telenovela seemed to be one medium through which women observed alternatives; then they appropriated them in order to assess their own lives and the life of the community in relation to that of the characters in the geographic south. This finding supports earlier reception study findings by Leal (1988) and Vink (1988) and later ones by Lopes and colleagues (2002), which demonstrated how telenovelas were used by women to explain their lived experiences. Nevertheless, women wanted these contemporary contexts to be presented within the framework of traditional melodramatic narratives. Female characters in the telenovela could be independent and hard-working and male characters could be sensitive and understanding, but in the end the romantic couples had to finish the narrative by getting together and confirming the happy-ever-after ending. Several women perceived the process of contemporization of telenovelas with greater emphasis on social and political discourse a distraction from the central objective of these narratives: the romantic and familial relationships between characters.

Males, on the other hand, saw this process of contemporization as a bridge to what they perceived to be a realistic narrative, which justified their viewing and enjoyment of the telenovela. However, the established norms and attitudes regarding gender roles in the community still limited the males' possibilities of acknowledging the melodramatic as enjoyable. Telenovelas, for these men, were valued according to their perceived informational/realistic content. There was a perception that their masculinity, many times thrown into doubt by their inability

to provide for their households, could be damaged even more by their association with a feminized text such as a telenovela. Males watching the telenovela preferred to talk about issues that interested them; in the case of *The Cattle King*, it was land reform and the rural lifestyle (La Pastina, 2004a). Even if these texts were perceived as feminine, men used the rural lifestyle and the political narrative to think about their lives in relation to the urban modern south (La Pastina, 2001). Their interest in these elements of the narrative seemed to indicate that perceived gender norms and patriarchal values did in fact hinder male viewers' engagement with the more traditional melodramatic elements of class ascension, love, and betrayal. This, however, does not mean that men did not pay attention to those elements or were oblivious to them. It means that they took a greater interest in elements associated locally with the masculine sphere, such as politics and farm techniques, rather than engaging with elements normally associated with the feminine sphere, such as child rearing and romance.

Intertextuality

In the context of masculine versus feminine characteristics of this telenovela, as they were perceived by viewers, it was through this contextual information (which I gathered beyond the in-depth interviews) that I was allowed to understand the implications of cultural capital for the interpretation of intertextual references in *The Cattle King*. The blurring between reality and fiction and the self-referentiality of the telenovela (Ott & Walter, 2000) were caused by the interactions between characters and real politicians in the news media and in the telenovela itself. Without access to the news media from the south or exposure to the national news media on television, it is likely that viewers would not have possessed the cultural capital (Bourdieu, 1984) required in order to engage with these elements of the narrative (see La Pastina, 2004a for a detailed analysis of this case). Consequently, current affairs knowledge was an important factor in the reading of these intertextual instances and in understanding the self-referentiality of this material. But a viewer needed more than current affairs knowledge. He or she needed access to other sources of cultural capital such as news magazines or newspapers and exposure to a broad range of TV programs – as well as experience outside the local community. All of these are central for the building of embodied cultural capital that can be used to decode cultural texts like *The Cattle King* according to genre expectations. It is unfair to expect viewers in a remote location such as Macambira, with the limited financial resources available to them, to have been able to acquire, and to possess, the embodied cultural capital that would have allowed them to observe and interpret references to content in other media, not available to them. Such findings support the view that telenovelas are authorial texts produced according to a particular agenda and with a limited concern for broader audience interests beyond the immediate ones of the urban middle- and upper-middle-class viewing population.

Although the intertextual nature of *The Cattle King*, along with its political and social messages, was missed by most Macambira residents, the telenovela was followed and appropriated by many local viewers, male and female, in the discussion of local politics. In a small community like Macambira, local elections are major community events that can affect one's life in dramatic ways. During the broadcasting of this program, Macambira was experiencing a conflict-full mayoral campaign, which became a central factor in the analysis of the telenovela. The subtexts of political honesty and land reform that were missed, in their intertextual complexities, by local viewers were nevertheless appropriated by them according to their actual, experiential knowledge of politics and land rights in the community. Ethnographic data allowed a contextualization of the residents' readings and interpretations thanks to the depth of the researchers' knowledge of these residents' everyday lives and their views on local and national politics.

News and politics are typically considered to be part of the masculine sphere, and telenovelas are mostly situated in a feminine domain. There is a cultural construction that links femininity to melodrama and telenovelas, but that is not a universal association. In the case of *The Cattle King*, the presence of a political discourse, perceived as an interpenetration of the traditional feminine text by "masculine" news, was the excuse that most men gave for being involved with the narrative. The gender dynamics within the community – women's limited political power, or their increased economic power and greater familiarity with the telenovela genre – helped explain their greater skepticism toward representations of politicians in the telenovela. But these women's readings may also relate to their experiences of bartering votes for food, jobs, and other benefits. The lasting effect of this telenovela can be seen in the fact that community members would still talk about the *The Cattle King* 13 years later, to describe a telenovela that gave them relevant information applicable to their lived experience.

The Limits of Product Placement

With the exception of a few younger and better educated audience members, most viewers in Macambira perceived product placement to be an integral part of the narrative, or they did not perceive it as such at all. Clothing and fashion trends in the text, for example, were not perceived as product placement, but as an inherent element of the genre: the glamour of upper-class urbanites. While the narrative's agrarian element prompted the Globo network to promote product placements targeting the rural and agrarian market segments, these insertions were seen by viewers, especially males, as part of the discourse on modern farm life as practiced in more developed areas.

If viewers in Macambira were oblivious to these product placements, this was not due to an inherent inability to understand the nature of advertisement; it was rather a result of social, economic, and cultural constraints related to their isolation from

urban consumer culture (La Pastina, 2001). The notion of engagement, introduced earlier in this chapter, helps to understand the relationship between viewers and product placement as a dynamic one, in which different viewers address the same text through different subjectivities, but also from within contextual structures that enable or constrain the text–reader relationship. The perspective introduced by engagement presents the relationship between text and reader as an active process, although not necessarily a conscious one, in which everyday life needs to be taken into consideration in the analysis of viewers’ interpretations of media texts.

In the case of some products that viewers chose not to use, for instance a particular brand of beer, the visibility of the product in the telenovela served to outline the notion of local taste, possibly reinforcing these viewers’ perception of their own identity as different from that of the people in the south, from where most telenovelas (and media in general) originate. It appeared that, in order to read these product placement insertions in the narrative, viewers were required to have a certain exposure to the products. But that did not guarantee that the product placement would be perceived for what it was. The difficulty of communicating specific product placement without sensitizing viewers may have limited the information gathered. The sporadic nature of some insertions – not all of them were presented regularly throughout the narrative – affected product placement perceptions, too – because not all viewers watched the program every evening. Unlike a plot that could be followed even if an episode were missed, commercial insertions required the viewer to be present and attentive at the moment of their occurrence.

Limited access to television commercials – which was due to the viewers’ reliance on a satellite dish that received only the national feed – might also have had an impact on the relationship between viewers and consumer culture. Still, most residents were aware of commercials, and many of them craved greater access to these snippets of consumer culture and to the goods promoted in them. The isolation of the community hindered this process of integration within the consumer mainstream, creating the perception of a peripheral state in which viewers did not have access to goods and lifestyles they desired. In limited ways, some of these lifestyles and goods did reach the community, promoting the absorption of this “foreign,” normally urban, reality. Mostly they arrived through television and were adapted, as was the case with fashion. The limited access to commercials might also be connected with the uncritical opinions about product placements held by some viewers. A greater familiarity with commercial narratives and products could possibly lead viewers to relate these textual insertions to the goods advertised in commercial breaks.

The interpretation of product placement seemed to be tied to traditional gender stereotypes about men’s and women’s roles in society. Men were much more attuned to the narrative’s rural elements, while women were more interested in elements connected with the fashion trends normally associated with the wealthy urban characters in the romance. This split seemed to be in harmony with the gender divide in terms of taste for telenovelas; and the latter’s utility, as perceived by men and by women, was placed in the different realms of information-gathering and pleasure.

For women, issues associated with beauty and leisure were more central, allowing them to chat about those images and trends with other community members. For men, the agricultural narrative, which related to a traditional source of income in the region, was seen as a venue for potentially useful information. Males looked for elements in the narrative that they deemed realistic; in the case of *The Cattle King*, this was the rural theme. That theme also allowed Globo to target rural consumers – mostly constructed as males by the network, through product placement. Male viewers knew about hats and other elements of men's fashion, but the telenovela served mostly to connect these men to something they understood: rural life. It also allowed them to talk about the telenovelas with other local viewers, without the potential feminization sometimes associated with telenovelas among rural populations (Almeida, 2003; La Pastina, 1999; Prado, 1987).

The emphases on certain levels of the telenovela narrative created a sense of peripheral status, of the telenovela being foreign to the urban, or even rural, reality portrayed on the screen. Foreign does not necessarily mean beyond national borders; it implies rather that a notion of center–periphery within the nation can create a cross-cultural distance within the national borders. Not unlike Abu-Lughod (1993, 1995), who, in working with rural groups in Egypt, noticed that these groups perceived themselves to be in the periphery of the nation, I found that people in Macambira saw themselves as being at the periphery of Brazil. This perceived gap between the industrialized south and the rural northeast may have led to a representation of the “other” as foreign. In this process local viewers felt isolated, estranged from the reality and culture of the Brazil represented on the screen. This gap did not seem to reduce the sense of belonging to the nation as a political entity, but rather it created a sense of injustice and inequality. It also created the impression of a cross-cultural conflict in which the values, morals, and attitudes of those from the south were distinct from those of the viewers in Macambira, even though they continuously invaded local reality through the media. In creating bridges between the local realities, rural and urban alike, mass media – and telenovelas in particular – promote access to information about events, ideas, lifestyles, and goods. In this process they define what is urban and, by default, what is rural, and they do it typically in terms of absence. This gap between what is available and what is seen on the screen may reinforce in the viewers a growing sense of being peripheral to the national and to global spheres.

The role of telenovelas in promoting a vicarious participation in the modern world (Leal, 1988) cannot be overlooked in Macambira. The desire to learn about fashion, lifestyle trends, and behavior was intrinsically associated with the process of watching television. Throughout the fieldwork, the growing access to multiple television channels with the help of an increasing number of home satellite dishes was fueling the viewers' knowledge of consumer goods and lifestyles. This growing participation in consumer culture may also have impacted viewers' awareness of media as a commercial enterprise. Nevertheless, the local isolation and the *de facto* limited access, as well as the meager financial means, remained a hindrance to a more complete

participation in the global consumer culture. Technological change may bring greater access to and awareness of this culture, but, as this case study has demonstrated, the cultural capital that is available to viewers remains a central element in the process of media interpretation.

Conclusion

Continuing my long-term involvement with this community, which I came to call “Macambira,” I returned once again in the spring of 2010 to conduct fieldwork. Telenovelas remain a vital form of entertainment in a community that has grown somewhat – to 2,800 inhabitants from around 2,000 in March 1996, when I first moved to Macambira. The levels of cultural capital necessary to decode telenovelas remain an important factor for audience members, as much as the content of the telenovela, if full engagement is to happen. In the spring of 2010 the prime-time Globo telenovela *Viver a vida* (*To Live One’s Life*) had much greater competition from other telenovelas and programs in several channels, which are now available in most homes, far more than had been the case with *The Cattle King* in the second half of the 1990s.

But the greatest challenger to, and enabler of, telenovela engagement was the Internet. It arrived in Macambira in 2007 and slowly became available to about one hundred homes, in addition to a three-computer Local Area Network (LAN) house. Through the Internet, viewers could search for information about the telenovela, follow the author’s blog, search for gossip about the actors, and shop. The Internet turned out to be a radical experience for a community that had lived in great isolation a decade earlier.

As discussed earlier, *Viver a vida* dealt with the difficulties of a former model who had become disabled. One of her former colleagues was black, and racial discrimination was addressed early in the telenovela, as well as the plight of the *favelados*, slum dwellers in Rio de Janeiro. In this context sexuality, healthcare issues, race, and disability were the topics that emerged in conversation about the telenovela. Unlike the 1990s, when a lack of cultural capital had been a factor limiting many rural viewers’ ability to engage with product placement and intertextuality, viewers in 2010 had a greater repertoire at their disposal for decoding these texts.

I have briefly mentioned these changes to indicate how audience ethnography and what I term media engagement allow for a greater understanding of the complexities of television audience membership and of the role it plays in the life of a community. The immediate and larger context where the viewing process takes place is relevant to the process of decoding and interpretation, as is the available mediascape in the community and the level of cultural capital necessary to understand the intertextuality present in the text. These characteristics change from community to community, from text to text, and they change over time.

Telenovelas, as I was told many times, have a central role in community life. The television set functions as an electronic storyteller, a bard (Fiske & Hartley, 1978), bringing into the community tales of “distant” lands and “foreign” practices. In this process, television exposes viewers to “practical inadequacies in the culture’s sense of itself” (p. 88). People incorporate and challenge values, norms, and beliefs presented in the telenovelas, which on occasions destabilize the culture from within. As has been clearly discussed in the reception literature, it is very difficult, if not impossible, to demonstrate cause and effect through this type of audience research. I would like to propose, however, that through long-term ethnographic work it is possible to understand how media texts such as telenovelas become part of the repertoire of the community, possibly serving to create social changes over time, though the accumulation of knowledge from these texts.

Audience ethnographies allow for the possibility of assessing the different elements involved in the reception process and of evaluating how these elements interact within the context of the locality in which the observation takes place, as well as with the culture and identity of community members. Television audiences are fluid; they present different characteristics in different situations, in response to different programs. “Watching television should be seen as a complex and dynamic cultural process, fully integrated in the messiness of everyday life, and always specific in its meanings and impacts” (Ang, 1991, p. 161).

Since their inception in Brazil, telenovelas have evolved from a melodramatic mode to a more complex genre, with multiple formats and complex narratives, a star system, and a wide fan base. But the structural changes that Brazil is experiencing – a stronger economy and a greater sense of its global presence – as well as the radical transformation of information technology are putting more and more pressure on this genre. Telenovelas’ audiences are increasingly fragmented, watching less live broadcasting and consuming more content online. An important area of research for telenovela audiences in Brazil will be to understand how the increasing presence of the Internet alters the role of telenovelas in the everyday.

The Internet also provides a unique opportunity to study fan communities and how these might be evolving, possibly creating a source of cultural capital for rural viewers who are unfamiliar with the urban landscape presented in most of these telenovelas. And the proliferation of cable and satellite services, together with the increasing consumption of imported programming through these service providers, might also be impacting viewers’ sense of belonging to the local, the national, and the global.

Using Ethnography to Understand Everyday Media Practices in Australian Family Life

Donell Holloway and Lelia Green

ABSTRACT

This chapter discusses the use of ethnography within a media and cultural studies framework to investigate media practices within Australian families. It begins by outlining the theory and practice informing audience ethnography research, and then it provides an overview of audience studies research in Australia over the past quarter-century. The chapter then draws specifically upon the authors' audience ethnographies, to illuminate how complex behaviors such as those associated with media consumption are best investigated from a suite of different perspectives: participant observation, interview, field notes, and an engagement with a number of informants within each household. The production of cultural value through engagement with such media as the television and the Internet crosses the boundary between the household and the wider world and requires self-reflection and analysis on the part of interviewees. In addition to this, media practices within the family are both an indication of and a constituent influence upon the family's social and cultural norms. Issues about "who lets whom use what and when" are major sites of negotiation for autonomy and independence as children mature within the family context. Thus, by studying media audiences via ethnography, researchers are offered a privileged insight into people's everyday lives.

Introduction

A lot of times, the kids will ring us during the week and say “I’ve got an assignment to do, I’ve got to use the Internet,” so I go, pick them up and they do their assignments here. (Jasmine, divorced mother of school-aged children who live predominantly with their father)

(Green & Holloway, 2004, p. 180)

This chapter addresses the notion of audience studies from an Australian perspective and, specifically, from the perspective of Australian audience studies researchers who embrace an ethnographic approach. Like researchers in other countries and regions, Australian audience studies researchers adopt a range of philosophical and methodological approaches. In focusing here upon ethnographic methodology, the authors do not intend to imply that this is the only appropriate framework for all circumstances, or even that it is the dominant approach. Further, there is no quintessentially “Australian” way to do audience studies research and, as will become clear, many Australian researchers are indebted to the foundational work of British and US audience studies researchers.

Commercial audience research with a focus upon ratings, focus groups, surveys, and “people meters” generates data of critical importance to advertisers and mass media organizations. In contrast, audience studies ethnographies are more likely to be relevant to policymakers and to academic scholarship – particularly to researchers, faculty, and students of media, communications, and cultural studies. However, no perspective arises fully formed. This chapter traces the history of the ethnographic audience studies approach, which was championed by the UK’s Birmingham Centre for Contemporary Cultural Studies through the work of David Morley, and examines its influence upon audience studies research in Australia. The chapter relies on the work of Daniel Miller to illuminate aspects of the discussion and to underline how people’s consumption patterns can build a sense of connection to others. Analogously with Miller’s approach, this study is allied with work that analyzes and emphasizes the social construction of the meanings and uses of technology.

The chapter offers an overview of three major strands in audience research. It charts the shift from research on audiences’ media preferences and on the programs they watch to newer work, which investigates more deeply audiences’/users’ contextualized consumption of communication technologies in the home; then it moves into a detailed discussion of the Australian approach to conducting and writing up ethnographic audience research. In contemporary work, audience members become the focal points of their own stories in terms of what they do, and why, when they choose to consume media, and in terms of how they use communication technologies in domestic spaces. The conclusion ties the chapter together, it underlines the ways in which this approach to audience studies makes visible audiences’ priorities

and negotiations, and it outlines the importance of showcasing people's everyday media and communication choices for empirical work on audiences.

Illuminating the theory and practice of researching audiences, this chapter draws specifically upon two audience ethnography projects. Most of the examples cited here are drawn from a comparatively large study, of 26 families with school-aged children (Green & Holloway, 2004), which was funded by the Australian Research Council (2002–2005) and examined the place of the Internet in Australian family life. The smaller study constituted Donell Holloway's research for the Masters degree (Holloway, 2003), which examines the spatial geography and the increasing number of media screens in Australian domestic spaces. Quotes from this second study will be indicated by the siglum "[Holloway, MA]." This is not to imply that the two projects chosen here represent the only, or the best, audience studies research coming out of Australia. Indeed the past generation of researchers in this field includes much exemplary work – for instance Palmer (1986b; now Gillard), Hodge and Tripp (1986), Ang (1991), Moyal (1995), Nightingale (1996), Lally (2002), Balnaves, O'Regan, and Sternberg (2002), and McKee, Albury, and Lumby (2008). The research presented here is one manifestation of the Australian approach to audience studies research.

Influences on Audience Ethnography in Australia

He [Matthew, 14-year-old son] prefers to use the lounge room because it is the bigger TV. It's also got the heater in it. At this time of the year it is the warmer room. It's also more comfortable [. . .] But also the other thing I think is because I'm usually in the kitchen and that's closest to, perhaps, where I am. It's also closest to where his food and drink is. But I like to think that perhaps it's also closer to [any] interaction with me.
(Mum, Lisa)

(Holloway & Green, 2008, pp. 50–51 [= Holloway, MA])

David Morley, Audience Studies and the Domestication of Technology

David Morley pioneered an approach to audience studies that put it in direct opposition to the kinds of ratings surveys that had previously been termed "audience research." Whereas most ratings were about quantifying and managing the audience (Ang, 1991), Morley's approach to studying audiences centered upon understanding the meanings that audience members made from their engagement with media products. This new, qualitative approach was initiated in the late 1970s, by Charlotte

Brunsdon and David Morley (among others), with a research project focusing on the British Broadcasting Corporation (BBC)'s evening magazine current affairs program *Nationwide* (Brunsdon & Morley, 1978; Morley, 1980). The *Nationwide* study was originally set up to interrogate Stuart Hall's (1973) influential encoding/decoding model of communication, which argued against the classic sender–message–receiver framework (Shannon, 1948a, 1948b; Weaver & Shannon, 1963).

The classic communication model saw any problems with the effective communication of meaning as resulting from “noise” or “interference.” Hall's approach was to critique all three elements of the Weaver and Shannon model. He argued that the sender does not have the power to determine the reception of the message; the message can never be transparent as to meaning; and the receiver (audience) has the power to read the message in a variety of ways (Proctor, 2004). According to Hall, any message sent would prompt one out of three possible readings in the receiver. The “dominant” reading was the communication intended by the message sender; a “negotiated reading” was one where some elements of the dominant reading were accepted and some rejected; and an “oppositional” reading occurred when an audience member rejected a reading in its entirety. Testing this out, Morley had unionists (oppositional) and managers (dominant) watch *Nationwide* content in two separate groups and recorded their very different reactions to the program. As a result of the *Nationwide* study, Morley argued that the meanings people make of media reflect their social and cultural backgrounds: ultimately, audiences invest media with meanings. This approach to audience research positioned audience members as powerful and as able to offer an affirmative response to media, which honored their specific view of the world.

Morley went on to develop a more naturalistic approach to audience research. One of the critiques of the *Nationwide* study was that a group of people rarely found themselves sitting down together for the express purpose of watching a television program and commenting upon it. Instead, the practice of media consumption was integrated into everyday life and was generally a domestic activity. Responding to these comments, Morley's next big project was *Family Television* (1986), a study of the consumption of television within the family home. Just as the *Nationwide* research was about the viewing position of the audience rather than about the content of the program, *Family Television* was about a lot more than the simple act of watching TV. In Morley's opinion, “the social dimensions of ‘watching television’ – the social relationships within which viewing is performed as an activity – have to be brought more directly into focus if we are properly to understand television audiences' choices of, and responses to, their viewing” (Morley, 1986, p. 15). Inevitably, given that *Family Television* was based upon interviews with couples, the book addressed gender, power, and domesticity as well as audience responses to program content.

Morley used his interviews with 18 families to illustrate the dynamics of television consumption in everyday life. As he was to put the situation subsequently, in Daniel Miller's (1995) reader on consumption studies, “Once one takes seriously the fact that

television is a domestic medium (and is characterized by program forms specifically designed for that purpose), it becomes clear that the domestic context of television viewing is not some secondary factor, which can subsequently be sketched in" (Morley, 1995, p. 316). Rather, argues Morley, "the domestic context of TV viewing, it becomes clear, is constitutive of its meaning" (p. 321).

By the early 1990s the theoretical frameworks developing around audience studies had expanded to examine the ways in which households "domesticated" technology. The "domestication of technology" conceptual framework was spelled out in a seminal chapter by Roger Silverstone, in collaboration with Eric Hirsch and David Morley (1992). The three constructed the household as an entity with permeable boundaries and saw technology as being drawn into the household to meet particular social and cultural needs. The dynamic of "appropriation" marked the stage at which a technology was desired, sourced, and procured for the household, while that of "objectification" addressed the placement of the technology and the relative access enjoyed by different family members. "Incorporation" described the way in which the technology was integrated within the rhythms and practices of daily life. Finally, "conversion" assessed the means through which the products of technology and the information, knowledge, opinion, and understandings forged through its consumption could be harnessed to the broader ambition of identity formation and the creation of cultural capital.

In a refinement of the original model, Silverstone and Haddon (1996) proposed that the creative processes of "incorporation" and "conversion" should be considered in terms of everyday innovation and everyday innovators. They argued that consumers of technology find novel and unanticipated ways of responding to the opportunities afforded to them (e.g., Marvin, 1988), and that this becomes evident when we examine the ways in which people construct their relationships with technology. Such a perspective ties in with the notion that individuals, even within the same household, inhabit dynamic communication ecologies that are particularly tailored for them (Carey, 1993; Sless, 1995). These ecologies are constructed imaginatively, according to the materials available, the needs of the individual, and the preferences of the people that an individual communicates with. Over the past 50 years television has provided much of the cultural raw material that audience members use as conversation topics and through which they construct their sense of a wider social project. Since the turn of the century, however, people in Western democracies have increasingly turned to the Internet as well for the provision of a context for their place in the world.

Within audience studies, when researchers analyze people's use of communication technologies, they also comment on how audiences use the products of mass, niche, and user-generated media. Audience members fashion semiotic material from the media in ways that express their personal values and pleasures, allowing people to connect with each other. This "conversion" phase marks the climax of the functional value of popular culture as embodying "social pleasures and meanings" (Turner, 1996, p. 42). Thus the domestication of technology framework is also

implicated in the theory of consumption, since a major role of information and communication technology, in terms of audience studies, is to provide access to programs and material that individuals can consume and convert into social currency.

Daniel Miller and the Theory of Consumption

They're almost expected [by the schools] to have computer skills and if they don't have the exposure to the variety of programs that are available then they don't learn those skills and the research that goes with it [. . .] What's the awful phrase? Knowledge is power. (Interviewee)

(Green, Holloway, & Quin, 2004, p. 90)

As the consumption of media tells us about audiences, so the social biography of an object illuminates the lives of the people who use it (Kopytoff, 1986). Studying the ways in which people consume goods, services, and content offers a holistic view of people's engagement with media and technology and indicates how patterns of consumption connect audience members with others. US academic Igor Kopytoff highlighted the cultural dimension of consumption by arguing that "things" had a social biography as a result of their contribution to the social lives of their users. He demonstrated that consumption is a process particularly revealing of social and cultural value. His famous biography of a car in Africa "revealed an entirely different biography [or history] from that of a middle-class American, or Navajo, or French peasant car" (p. 67).

Daniel Miller's work *Material Culture and Mass Consumption* (1987) ties the consuming subject to the contexts of household and mass production – including the production of mass media. His theory was tested in fieldwork in Trinidad that examined Trinidadian audiences' consumption and conversion of *The Young and the Restless*. At first glance this television series might seem to be an unlikely point of focus for Miller's work on consumption in a struggling postcolonial nation like Trinidad. The program deals with the improbable lives and loves of an ill-assorted collection of mainly white American characters, predominantly young and/or socially and sexually restless. Yet Miller could not ignore the great importance that his interviewees placed on being able to watch each episode of this soap opera:

Few televisions fail to attract a neighbour or two on a regular basis. Individuals may shout deprecations or advice to the characters during the course of the programme. Afterwards there is often collective commentary and discussion. There is a considerable concern to spread news of important events quickly. I was slightly "shocked" in my vicarious sense of propriety, when an important Muslim festival I was watching was interrupted by three ladies who collectively announced to the assembled group some new development which we had missed by taking part in the ceremony. (Miller, 1992, pp. 168–169)

Miller tried to rationalize the importance of the program for its Trinidadian audience and argued that it reinforces the “bacchanal as the lesson of recession [. . .] [a lesson] which insists that the domestic and the façade of stability is a flimsy construction that will be blown over in the first storm created by true nature” (p. 179). The idea here is that the seeking of pleasure and enjoyment are appropriate responses to deprivation, and that what may appear regulated and ordered on the surface is in truth only a veneer. Miller goes on to suggest that the program “colludes with the local sense of truth as exposure and scandal” and that audience members use the program as a way to discover and discuss the vagaries of appearance and reality, hope and fear, which make sense to them as a narrative for their daily lives. In this way *The Young and the Restless* “is not just Trinidadian but [. . .] ‘True True Trini’” (ibid.) and is identified by Trinidadians as communicating fundamental realities germane to their lived experience.

While the mass audience may be conceived of in terms of its international dimensions, audience studies research is concerned with uncovering the local construction of global culture (Morley, 1991). Given that elements of popular culture are valued and traded in debate and discussion, it is gossip, the exploratory and the new that has greatest conversion value and is the easiest to trade socially. Dynamic by nature, popular culture is continuously reinventing itself in local cultural exchange. Meanings are constructed collaboratively, at the level of the household and the individual conversation, through the circulation and exchange of ideas, memories, and opinions prompted by media products. Audiences are active in their use of media materials both as a means of communication with others and as a way in which to make sense of their world.

The Social Construction of Technology

It's great for this spontaneous kind of thing [. . .] I do communicate with France, with my friends [there]. Not extensively, but here and there I send an email. I go online and then I usually send everyone an email quickly when I've got a couple of hours. (Nadia)
(Holloway & Green, 2003, p. 11)

Both the domestication of technology and the theory of consumption sit within the overarching conceptual framework of social constructionism (Berger & Luckmann, 1966). Social constructionism is a branch of epistemology (the study of knowledge, one of the traditional branches or “parts” of philosophy); hence it is concerned with the philosophical understanding of what people know and how they know it. Within the general debate about knowledge, social constructionism is sometimes positioned as the opposite of essentialism (Oderberg, 2007), which is built around the contrary idea that things have an inherent or essential meaning that underpins, but is entirely separate from, the ways in which they are socially constructed.

Social constructionism refers to the shared effort of a group, community, or entire society to construct meanings around an object or thing. For example, a number

of human societies construct the “pig” as “unclean” or “polluting”; in contrast, others construct it as ham, pork, or bacon. Communities and associations of animal rights activists might construct the “pig” as an intelligent animal, generally held in circumstances of unimaginable deprivation and tortured in order to provide humans with food that is often too rich in calories for their own good. In all these ways, argue social constructionists, the project of the construction of meaning is a social one, in which people deepen their understandings through shared discussion and through shared actions that put those understandings into practice. Discourse and narrative analysis become, accordingly, useful tools for understanding these socially produced “writings.” Key theorists in this field include Game (1991), Searle (1995), Hacking (1999), and Burr (2003).

The social construction of technology (SCOT) is generally associated with the work of Pinch and Bijker (1984), which was further developed by Bijker, Hughes, and Pinch (1987). It offers both a theory and a methodological approach that sets out a series of steps to follow when analyzing the uses of a technology. Within the SCOT framework, particular emphasis is placed upon “relevant social groups,” principally the producers and the users of a technology. Such “relevant social groups” can also include regulators and journalists, for instance. While one criticism of the SCOT approach is that there are no objective tests as to what constitutes a relevant social group, within the context of social constructionism the identification of any relevant social group is itself the outcome of social constructionist processes.

As social constructionism can be contrasted with essentialism, so the social construction of technology can be contrasted with technological determinism. Technological determinism argues that the “nature” of the technology determines its effects. One example of the technological determinist perspective is Theodore Roszak’s polemic against the computer:

No matter how high the promise of that age [the information age] is pitched, the price we pay for its benefits will never outweigh the costs. The violation of privacy is the loss of freedom. The degradation of electoral politics is the loss of democracy. The creation of the computerized war machine is a direct threat to the survival of our species. It would be some comfort to conclude that these liabilities result from the abuse of computer power. But these are the goals long since selected by those who invented information technology, who have guided it and financed it at every point along the way in its development. The computer is their machine; its mystique is their validation. (Roszak, 1994, p. 233)

A social construction of technology approach argues that the social potential of a technology changes over time, according to its use. The fact that the Internet was originally the creation of the United States Department of Defense’s Advanced Research Projects Agency does not mean that it is only ever, and can only ever be, a technology of war (Green, 2010).

Australian Audience Studies

Writing [emails] on the internet has that sort of anonymity that talking on the phone doesn't, like writing letters to and fro to people, but it's also immediate so you [have to] be careful what you say because you can say the wrong thing and then "Bam!" (Donna, discussing communication with her ex-husband during the breakdown of her marriage)

(Holloway & Green, 2003, p. 10)

When many Australian researchers argue for an "ethnographic" approach to audience studies (Gray, 2003), they are constructing a specific notion of ethnography, which suits their own purposes. It is ethnography that placed David Morley in the living-rooms of families and couples, to view along with them their shared and separate television programs. This approach to ethnography eschews the idea that it is still appropriate to gather together a group of people who would never usually watch television in each other's company – and to do it with the aim of sitting them down, screening a television program, and getting them to discuss it. For many Australian scholars, an ethnographic audience study aligns itself with *Family Television* and away from *The Nationwide Audience*, but it still accepts the insights provided by both research projects. It understands that the audience is powerful in its capacity to make and communicate meanings, and it assumes that this meaning-making power is most accessible to researchers in domestic spaces.

As in most Western democracies, there are three key components of Australian audience research: (1) research that informs policy and regulatory debates, which is often government sponsored; (2) research that has a marketing and sales focus; and (3) "academic" research, which investigates the importance of the media in people's lives and places media consumption within theoretical and conceptual frameworks. Each of these three areas will be briefly addressed, the greatest attention being paid to academic research and to key Australian scholars who have influenced the field. Audience research is often combined with content and textual analysis, so there is some specificity about the media programs to which the audience is responding.

Regulators and policymakers are interested in audience research because they believe that media has effects on audiences, even if it is unclear what effects occur in whose case, how, and when. This "media effects" hypothesis justifies some regulation of the media, for example the classification of movies and computer games that restricts them to audiences of the appropriate age. In post-World War II Australia the key authorities concerned with regulating broadcasting have changed over time, in response to developments in media, policy, and legislation. These successor institutions are the Australian Broadcasting Control Board (1949–1976); the Australian Broadcasting Tribunal (1976–1992); the Australian Broadcasting Authority (1992–2005); and the Australian Communications and Media Authority (ACMA; 2005–2011). The Australian Communications and Media Authority (2007) carried out a major

study titled *Media and Communications in Australian Families*, while the Australian Bureau of Statistics also investigates such issues as Australian households' use of information technology and Australian Internet activity and access (2010a, 2010b).

Ratings research began as a means through which marketers and consumer behaviorists investigated and managed audiences, but academics soon began to use it to theorize the disciplining of audience members for commercial purposes. Critical theorists ultimately constructed the mass media as a way of delivering audiences to advertisers (Smythe, 1981). Australia's particular contribution to the field of ratings research lies in Ien Ang's (1991) seminal work on *Desperately Seeking the Audience*, Balnaves and colleagues' (2002) edited collection on *Mobilising the Audience*, and Balnaves, O'Regan, and Goldsmith's (2011) *Rating the Audience: The Business of Media*.

Whereas the ethos of the regulatory approach is based on a view that it is comparatively unproblematic to decide what is good and what is bad for would-be audiences, commercial audience research seeks to understand the media preferences of target publics, so that they can better deliver carefully tailored messages. The effort that goes into policymaking and commercial research indicates that audiences are problematic and can be unpredictable. Ideas about the active audience naturally follow on from the realization that different people form different understandings of the same media products, which means that they engage actively with what they consume. Over the past 25 years Australian academic audience researchers have tended to take an "active audience" approach to their work, which started with a burgeoning of research and publication in the mid-1980s.

The year 1986 was a good one for the new field of audience studies research in Australia. Bob Hodge and David Tripp (1986) published their book *Children and Television: A Semiotic Approach*, while Patricia Palmer (now Patricia Gillard) paid particular attention to girls' reception of television (1986a) and to the role of television as a source of material for children's play (1986b). In the same year an influential paper by Virginia Nightingale asked: "What's happening to audience research"? It was a precursor to her monograph on audiences (Nightingale, 1996).

Ann Moyal studied a different kind of "audience." In 1988 she investigated Australian women's uses of the telephone, conducting in-depth interviews with 200 women aged from 15 to over 75 and analyzing the participants' diaries in which they recorded their daily phone use. Using these data, Moyal suggested a distinction between "intrinsic" and "instrumental" uses of the phone where the latter involved information-seeking and the conduct of business (Moyal, 1995). Except for women who worked from their homes (who made 10–12 instrumental calls per week), Moyal's respondents averaged 2–6 instrumental calls over a 7-day period. This comparatively low level of instrumental activity contrasted with the high level of intrinsic calls: 20–28 per week, averaging about 15–20 minutes in length, but sometimes lasting up to an hour (ibid.).

The major purpose served by Moyal's respondents' intrinsic calls was "kinkeeping" (p. 289). This was Moyal's term for her respondents' use of prolonged and frequent communication to maintain and strengthen links with family and friends ("kith and

kin”). Kinkeeping meant that people who were emotionally connected with one another also remained closely aware of what was going on in each other’s lives. Citing Lana Rakow’s (1988) US studies, Moyal identified a major gender aspect to this emotional work, wherein kinkeeping was particularly recognized as “women’s business,” or “gendered work” and “gender work” (Moyal, 1995, p. 304).

The first Australian audience studies about computer usage began in the 1990s. They included Elaine Lally’s ethnographic study of computers in Australian homes, the arrival of the “personal computer” years before the domestic introduction of the Internet. Although Lally’s work was from the mid-1990s, it was published internationally in 2002 and included photographs of the family computer’s location in the domestic environment, helping the reader understand its place in the spatial and temporal fabric of the respondents’ homes. Robyn Quin and Jack Seddon followed Lally’s lead, but they specifically studied families with school-aged children and they investigated their use of the Internet. The fieldwork was carried out in 2002–2004, on the cusp of the transition from dial-up connections to the always-on broadband – and, ultimately, wireless – services. Some aspects of the research are included in Green (2010).

A recent Australian ethnography with a difference, by Alan McKee, Kath Albury, and Catharine Lumby (McKee et al., 2008), researched 1,000 members of the Australian audience for pornography, alongside contributions from producers and distributors of pornographic digital versatile discs (DVDs). A number of respondents contributed further to the research through in-depth interviews, and the results were published in *The Porn Report*. The authors argue that there is little evidence that pornography has negative effects among adult users, and they suggest that research that indicates otherwise has generally involved exposing non-pornography users to pornographic materials in laboratories: an unrepresentatively artificial environment. Additionally, the study indicates that most respondents believe their use of pornography offers positive benefits.

The Ethnographic Audience Research Approach

This chapter now considers ways in which ethnographic audience research may be approached and conducted. In general, an ethnographer, in embracing the ethnographic method, is making his or her presence explicit in the research. Skeggs, discussing feminist ethnography, comments that it is

[a] theory of the research process – an idea about how we should do research. It usually combines certain features in specific ways: fieldwork that will be conducted over a prolonged period of *time*; utilizing different research techniques; conducted *within the settings* of the participants, with an understanding of how the context informs the action; *involving the researcher in participation* and observation; involving an account of the development of relationships between the researcher and the researched and focusing on how experience and practice are part of wider processes. (Skeggs, 2001, p. 426)

Ethnographic audience research ticks most of these boxes, although an ethnographer in the anthropological tradition would quibble about the notion of “a prolonged period of time.” The period of time is prolonged in relation to that required by a survey or a focus group alone. In contrast to the survey, an ethnographic investigation involves multiple points of contact with the research unit. This unit can be the household, the parental couple (as in Morley’s case), or the individual within the household. The research approach discussed below stems from the authors’ Australian Research Council-funded “Internet in Australian family life” (IAFL) project. Eligible families had at least one child still at school and family members were interviewed separately, usually on two separate occasions.

The Semi-Structured Interview

A semi-structured interview approach utilizes a “guide” to the important topics to be covered in every interview, but it accepts that not all interviewees will wish to respond to all the aspects of the research in equal measure. Instead, the ethnographic interviewer learns more about his/her respondents’ views by allowing individual interviewees to set their own agenda within the research framework. This approach also allows for a more authentic communication and a more responsive exchange, and it genuinely values the interviewee’s input more than would be the case if the researcher determinedly inflicted the same questions upon all the respondents in the same way, using the same words and the same order in asking. Ethnographic audience researcher Shaun Moores describes his interview technique:

Interviews were relaxed in manner and conversational in tone – lasting up to two hours – and whilst I kept a mental checklist of key topics to be covered, informants were allowed the space to pursue issues which they perceived as important or relevant. They were actively encouraged to speak from experience and to relate episodes from their everyday lives. My style of questioning was chiefly open-ended, designed to produce narrative responses rather than brief answers. (Moores, 1996, p. 34)

Open-endedness implies lack of closure. As well as asking open questions, openness can be introduced through the use of multiple prompts: “Anything else?” Such flexibility and prompting limits the number of interviews that can be conducted in a day: it is unwise to schedule more than three, and they should be at least three hours apart. This gap allows for a break for the interviewer and ensures that he/she has time to travel to the next (interviewee-determined) location even if the first interview has lasted for up to two hours. In an ideal situation, researchers should offer the interviewee as much time as he/she wish to take. While the “average interview” length is typically one hour, the interview itself is usually preceded and followed by hospitable social exchange and by unrecorded general discussion, which can later be captured in the researcher’s field notes.

Interview as Social Event

The interview is itself a social event, and the researcher is embedded in it. The researcher is required to open communication, to establish trust, to offer an invitation and have it accepted, to travel to a convenient place of the interviewee's choosing (usually at the interviewees' home), to be welcomed there and offered refreshments. Once settled, the researcher and the interviewee participate in a face-to-face exchange that restates the reasons behind the research and the expectations of both parties. The researcher takes field notes of what is said and of what is seen. When the research involves technological equipment, such as a computer and access to the Internet, issues of objectification and incorporation remain important. Usually before the interview, sometimes after, the researcher asks about the placement of computers in the home. Typically, the researcher might ask to see the computers and the modem. He/she might check the access through broadband or dial-up. Is there more than one computer, and, if so, how many are connected to the Internet? Is the connection wireless, or does it use cable? Why are the computers placed in the positions in which they are found? At some point the researcher might ask and receive permission to take photographs of the computer work stations (Holloway, 2003; Lally, 2002); and in mid-discussion he/she might ask permission to turn on the recording, just so that he/she don't miss anything.

This ethnographic approach locates the interview within the context of a social information-giving exchange. It encourages the interviewee to talk about what they know: their family's approach to the Internet and the technology and telecommunications services required for accessing it. The ethnographic method values the everyday patterns and rhythms of family life and is passionately interested in the ways in which the family negotiates rights and opportunities for access. These are all areas upon which the interviewee is an expert and, as that expertise is recognized, the relationship develops and the interviewee warms to his/her topic.

Multiple Voices and Data Triangulation

The ethnographic interview has a rhythm: it typically ranges from half an hour to two hours in length. These parameters tend to reflect age and gender, as well as the sense of connection established between interviewer and interviewee. Domestic social life usually allows for one or two interviews in a single sitting; but, almost invariably with a household of three or more people, the researcher has to arrange a second visit to complete his/her work with the family. This is not a problem: it offers further validity to the approach. It offers the researcher an opportunity to check on different perspectives with different family members. Interviewing the parents and their child separately offers an element of "triangulation" and a range of viewpoints upon a topic:

Father of two, Xavier, expressed his concern about (what he perceived as) his teenage son's excessive use of the internet: "Well I think there's far too much time [. . .] Gavin'll spend a whole day on it. I try to get him to come to the footy on Sunday. No. He's available for friends [for online gaming and chat on the internet]. He'll spend all day on the computer" (Xavier). Son Gavin (16), in a separate interview, anticipated that this criticism had been made and felt compelled to counter it: "Well he [dad] makes comments like saying I'm not fit enough 'cause I spent too much time on the computer but I play soccer a lot. Like, I do sport perhaps everyday at school [. . .] I mean, I think, such a piece of crap (Gavin). (Green et al., 2004, p. 94)

Triangulation is a term borrowed from map-reading and surveying, which addresses a process through which a range of separate points can be used to identify and cross-check one unique location. This allows the person taking the readings to feel confident that they are indeed where they think they are. In ethnographic audience studies this triangulation dynamic is harnessed when field notes, interviewee comments, observations, and repeated visits all point to the same outcome. Thus Gavin and Xavier's exchange indicates that there is a discussion in the home about whether the teenager spends "too much" time on the Internet and what other activities might be consequently displaced. Triangulation allows the researcher access to information about complex beliefs and behaviors, and to multiple points of view.

Repeated visits also allow researchers to monitor change. Even the time between separate visits can be illustrative. For example, in Donell Holloway's Masters research, it became evident that a six-month gap was sufficient to identify a process of "cascade adoption." When revisiting two of the families within her six-family study she found that they had each recently purchased new or add-on technologies. Even though research participants had not anticipated the purchase of these technologies at the time of the initial interviews, within six months they had often "upgraded" their equipment or services by moving from dial-up to broadband or from one point of connection to wireless, or by buying a laptop as well as a desktop. One family had purchased a new, more powerful computer for the household, while another had acquired broadband access. The reasons for getting upgraded technologies are not always simple or unidimensional. Single mother of three Theresa (below) explained that a combination of pester power, changed work conditions involving less information technology (IT) support, and the prospect of improved connectivity influenced her decision to subscribe to broadband. She outlined her reasons in an email to Holloway:

We now access the Internet via broadband. I think this was from April 2003. There's a number of reasons for this: It's quicker, Nathan [15] was nagging cause ADSL is a better connection than the dial up modem for his gaming (which kept cutting out), and work advised staff that it was no longer supporting the option of giving staff access to the Internet from home (as they could not guarantee that this was complying with their AARNET responsibilities) via the dialup modem. And it is a much better service / access from / via the new ISP (Theresa, 44). (Holloway, 2003, p. 95)

Sometimes this cascade adoption occurred even though such a move had been explicitly ruled out in the earlier interviews.

Interviewing Children

On occasion, research participants are too young to be formally interviewed, yet their insights are still extremely important. This is especially the case if researchers wish to understand the means through which children enter Internet culture and become “enculturated” to the online environment. In her fieldwork Holloway, who is an experienced primary school teacher, encouraged her younger interviewees (aged approximately 5–10) to draw pictures of their ideal rooms, including where they would put a computer. These images provided access to a range of material that could then form the basis for a discussion with the child. This technique has also been used by Livingstone and Bober (2003).

One such image from Holloway’s work is included here, and represents Rhianna’s fantasy bedroom. Rhianna was aged 10 at the time of her interview, and her drawing reflects the desire of many children to use their bedroom as a “private place for socializing, identity display and just being alone” (Livingstone & Bober, 1998, p. 24). Rhianna’s fantasy disco space (below) also seems to distinguish this as a pre-teen girl’s fantasy bedroom. Pre-teen girls tend to use their bedrooms as “private place[s] for the enjoyment of personal music” (Marshall, 1997, p. 74).

Rhianna’s fantasy bedroom, with its media technologies as well as a funky hand chair and disco room, influenced (as she explained) by the retro film *Austin Powers*, acts as a reminder that contemporary children’s culture often seems quite

Figure 16.1 Rhianna’s fantasy bedroom.

indistinguishable from consumer culture. Children's involvement in a consumer culture, which is distinctly different from adults', is a relatively new Western phenomenon. It reflects a shift in the status of children and childhood, from a time at the start of the twentieth century, when large families were an economic asset, to much smaller numbers of "high-investment" children, one hundred years later. As children became liberated from the labor market and put into schools; as economic development and improvements in the standard of living provided increased "domestic well being; more clean clothes; more varied diet; cleaner, larger living spaces; more heating" (Seiter, 1998, p. 302); and as women's participation in the workforce increased, so, Seiter argues, a children's consumer culture steadily emerged.

This children's culture was an important part of Holloway's research into the increasing numbers of screens in people's homes and into family members' uses of the Internet in daily life. As well as asking children to talk to her as they drew their ideal rooms, Holloway would sit with the children and get them to show her how they used the computer. This included noting whether the child could turn the computer on him-/herself, seeing his/her folders, files, and favorite Internet sites, and finding out whether he/she used instant messaging software to talk to friends online. While older interviewees less commonly required such concrete ways for their knowledge to be accessed as part of the interview process, these strategies were useful with quiet teenagers, who were willing to contribute but who found "discussion" too taxing or difficult.

The use of these different ways of accessing information about individuals' and households' Internet culture involves some risk. The more data are collected, the greater the likelihood is that researchers will drown in details and find it impossible to process the material to their satisfaction. In ethnographic work it is important to maintain a sense of both the wood and the trees, as well as to have an understanding of what is already known in the field and of what is new, or specific to the project at hand. It may be impossible to do justice to all the data collected, but it is important to aim for a holistic overview as a means of identifying and disseminating critical elements of the findings. It is to the techniques of processing and analysis that this chapter now turns.

Processing and Analyzing Data

It [a teenage son's use of pornography] doesn't bother me at all. If he wants to do that then he can do it because he'll get sick of it and I think initially it was "let's see what we can do." I remember once, he called me in and says "Mum, come and look at her boobs" and I looked at it and I said "it's disgusting" or something and walked away and he laughed his head off. But I've never come in and found him looking at that stuff. I remember once, but I was home when he was looking at it. It's just not – [it's] something that I'm not really worried about. It's up to him.

(Green et al., 2004, p. 92)

The primary data in ethnographic research tend to consist of full transcript records of tape-recorded in-depth interviews; field notes and other researcher-noted observations; and specially created ancillary documents such as interviewees' drawings and photographs. Typically these elements will constitute a full text database that can be analyzed through the use of qualitative interpretative software such as NVivo. This analytical process is designed to facilitate an uncovering of the unconscious meanings and organizing principles used by interviewees to construct their view of the world. Making visible these underpinning elements of belief has some parallels with a "grounded theory" approach to analyzing data (Glaser & Strauss, 1967; Strauss, 1987; Strauss & Corbin, 1990), although the authentic use of grounded theory is to create new or revised theoretical propositions, which are grounded in qualitative data that can be further explored by other research.

While data analysis of large sets of verbatim materials can be thorough and complete and can seem to be objective through the use of appropriate software, there is always a subjective element determined by the researcher. This subjectivity is implicit in the decisions about who is interviewed, in the questions asked, in the size of the interview sample, in the inclusion of other research materials, and in the identification and use of themes from within the data. Two categories of transcribed data tend to be selected for inclusion in the writing up phase. The first priority is to identify interviewees' "common" experiences: insights and comments that recur in different contexts, offered by different interviewees. The clearest or most evocative statement of that common experience is the best one to use. The second set of sought-after data is the exceptional remark: the outlier. Including minority perceptions uncovered in the research is one way of offering balance and of honoring the diversity of the research population. It is also a demonstration that the people chosen and the questions asked have avoided the construction of a false conformity. A divergence of views brings the research to life.

In acknowledging the subjective element necessarily introduced in human communication by the research process, good ethnographic research often provides the reader with information about the ethnographer and his/her relationship with the research participants and, where this exists, his/her connection with the funding body. Sometimes research remains good even when the researcher has been unable to afford the time or cost of full transcription and has instead worked from partial transcripts. Such an approach can be justified by assessing field notes and summary data of the total database, with a view to identifying relevant themes. Following this meta-analysis, the researcher can drill down through the data to access the interviewees' verbatim comments related to the themes identified. These interview snippets are subsequently transcribed. In this semi-transcribed approach subjectivity is foregrounded more than is the case with a full-text database, but all ethnographic audience studies research is subjective.

Good ethnographic research does not concentrate upon establishing in any detail consistency between researchers from different projects, or between a project's interviewees. Instead, the aim of ethnographic research is to achieve what Geertz

(1973) calls a “thick description.” Talking about ethnographic anthropology, Geertz comments: “Rather than generalizing across cases, which is the normal scientific procedure, interpretive anthropology aims for ‘thick description’ by generalizing deeply within cases” (p. 26). In contrast with the primacy accorded by Geertz to thick description, Barrett (1997) takes the view that it is “the burst of insight” that characterizes “a well-developed sociological imagination and a flair for perceptiveness” (p. 249). He comments that,

although long periods of fieldwork and hard work are prerequisites to sound ethnography, these alone will not generate bursts of insight [which involve] deep penetrations into the minute details of people’s everyday life, quick perceptions that allow the field-worker to understand their innermost motives. (Barrett, 1997, p. 248)

All the direct quotations used in published research and final reports must come accurately from tapes that can be deciphered audibly and that are appropriately referenced and stored. Whether or not a full text database exists, the reader has a right to expect that verbatim quotes are verifiable. Even so, it is sometimes important that the respondent cannot be identified, and details of individual speakers are often partially fictionalized. Indicative biographical data are useful, however, and help the reader identify with the research and its findings. Naturally, only ancillary identifying information can be fictionalized – not verbatim quotes. Given this, it might sometimes be appropriate to fictionalize a place, if that place is not critical to the research or to the interview, and to fictionalize the names of people referred to by an interviewee. As a rule of thumb it is important to give an interviewee the possibility of hiding behind a “fact” in the research, if he/she is challenged by persons who think that they have recognized a speaker. In such cases an interviewee can make a statement like “Of course that’s not me, the interviewee quoted in that research has three children and I have one: it’s someone else.”

Ethnographic research offers a conversational input into research findings. This needs careful handling when one is writing up the research. It can be tempting to simply string together a patchwork of vivid quotes that, together, offer a “rich, deep” illustration of a theme. This is not good practice in Australian ethnographic audience studies research because it distracts from the goal of achieving rigorous analysis that underlies all good research outputs. Instead, quotations generally have to be introduced as an explicit illustration of a point being made, and also commented upon afterwards, in order to tie the verbatim quote clearly into the argument. In this way the research is not overwhelmed by the ethnography.

Conclusion

This chapter has described the Birmingham Centre for Contemporary Cultural Studies’ approach to audience studies and has highlighted the importance of David

Morley's work in establishing the active role that audience members play in constructing meaning from media texts. It has also provided an overview of audience studies research in Australia over the past quarter-century, and it has positioned the authors' work in this context, subtly indicating that the notion of an active audience is now interrogated in terms of the media technologies that the audience in question uses as much as of the media programs the audience consumes. Thus an ethnographic study of multiscreen use in the family home (Holloway, 2003; Holloway & Green, 2008) or of family Internet use (Green et al., 2004) is a research response to emerging technocultures, as well as to changing media content. Once audience members are studied for the technologies they use, it becomes possible to see the connections they construct and maintain with others through technology-based communication. This reshaping of the field, made for the purpose of investigating how and why audience members use technology to connect with others, is now as important to audience studies as the meanings that these members make from content (if not even more important), and it puts the audience members and their priorities firmly at the center of the research paradigm:

When Lesley [the respondent's son] was looking at houses to buy in the east, I'd be on the Internet having a look as well to see what was on sale. "Lesley, have you looked at this one at such and such an agent?." So I'm on the west coast and he's on the east coast, [I'm] house-hunting for him over there [. . .] Now it's a [my] screensaver, his little house. It's awesome, so that kind of thing's really neat, to be able to bring family that are far away closer (Donna). (Holloway & Green, 2003, p. 8)

Ethnographic audience studies research requires an intensive commitment on the part of the researcher and an authentic engagement with the research participants. As a methodological approach, it has evolved over the decades and has been repurposed by media and communications scholars from the raw materials of methodologies used in slightly different contexts within sociology and anthropology. Ethnographic audience studies also privileges and celebrates the domestic and the everyday. It recognizes the value of understanding common experience, of exploring why people enjoy soap operas on television or reality TV. It avoids the value judgments of "high culture/low culture" debates and acts as a corrective to them. Given that one goal is to understand "social pleasures and meanings," the usual site in which these are produced is the domestic arena. Here people are more able to do what they wish in the ways they wish to do it: free from the constraints of employers and paid work regimes. Insofar as gender and age constraints prevent interviewees from consuming media in the time and place desired, ethnographic audience studies research can illuminate the power dynamics within the home and interrogate the mechanisms by which these power dynamics change – for example, as children get older and demand greater autonomy and responsibility.

Ethnographic audience studies is not so much about media consumption as about investigating the ways in which people consume media while forming and expressing their individual identities. Audience members use the media to construct an understanding of the society in which they live, of the ways in which their lives intersect

with that society, and of the means through which they are integrated within their social world. These understandings become accessible to the researcher from the rich data provided in in-depth interviews and from insights that illuminate the researcher's experiences, as well as the research participants' social practices and roles in different settings. While ethnographic audience research is subjective, it is also authentic. This research methodology offers many advantages as a way of explaining the importance of the media and of technologies of communication for the routines, rhythms, and events of everyday life.

Beyond the Active Audience

Exploring New Media Audiences and the Limits of Cultural Production

Shayla Thiel-Stern

ABSTRACT

The digital media landscape presents unprecedented opportunity for research on media audiences, as the latter navigate and make sense of the new media. Although studies on how audiences make sense of news, information, and commercial discourses are very important, scholarship must take into account that – particularly in the era of Web 2.0 – the audience is neither “passive” nor simply “active” in how it makes sense of the media. Rather, the new media have almost fully collapsed the differences between audience and producer. This chapter applies Bourdieu’s understanding of cultural production to the study of new media audiences, reflexively focusing on research on girls’ use of one interactive media tool: instant messaging. However, the chapter also acknowledges how patriarchal hegemonic structures within the “old” media, the corporatization of the Internet, and issues of access prevent a universal interpretation of any new media audience; and, although spaces of resistance are available through the audience’s power to produce cultural artifacts, the scope of this resistance is still limited.

In a popular painting, *The Treachery of Images*, by René Magritte, a pipe is famously pictured floating above the phrase *Ceci n'est pas une pipe* ("This is not a pipe") presenting a paradox and inviting its viewers to question further the notion of what is represented before them.

As I sit down at my computer, staring at a screen filled with windows of Facebook, blog comments, "friends" awaiting invitations to chat, a Twitter feed, and good old-fashioned email, I can practically envision a sentence floating beneath the monitor: "This is not an audience" (or, to paraphrase Magritte, *Ceci n'est pas un public*). Despite all of the audience comments and status updates before me, and despite the fact that the audience appears to be actively reading and engaged as well, this is not an audience.

Or rather it is not an audience in the sense in which we, as media scholars, have traditionally considered the audience. Certainly, the audience has always been active to a certain degree. For the sake of making a point about activity, one could refer to the very active – vociferous, sometimes downright noisy – theatre audiences of the late eighteenth century. It is also important to consider mass media research paradigms in which some audiences were conceived of as being not particularly active. Many felt that newspapers and broadcast media did not allow for true interactivity, and this could be true; despite the active meaning-making process that many critical scholars from the early 1980s onward attributed to the audience, some mass communication scholars today conduct studies that still seem to consider traditional mass media messages to flow directly from the medium to the receiver. However, even traditional media effects researchers must acknowledge the challenge that the interactive nature of new media poses for one-way paradigms of media – audience interactions. So, for all intents and purposes, the audience today is not an audience.

In fact this point must take us toward the realization that the new media audience is so much more than just an audience. This chapter seeks to track the negotiated meaning of "the audience," from early Internet audience research to studies in the era of Web 2.0 and beyond, by focusing on two crucial ideas. First, the audience is now also a producer and gatekeeper. Second, the audience is now its own audience (and, perhaps even more crucially, that audience is aware that it has an audience). In the final part of the chapter – keeping in mind this complicated, negotiated construction of the new online audience – I will discuss two of my own qualitative audience-focused research studies to illustrate how this shifting audience presents both opportunities and challenges within the digital media environment.

The Audience as Producer

Although the field of audience studies has a long history in media studies, this chapter, which is by no means exhaustive, focuses on new media audience research in cultural studies – research that relates to youth culture. The chapter takes a selec-

tive path to illustrate certain conceptual points about audiences/users/consumers from previous research. However, it is helpful to begin here by using one of the earliest and best known communication models as a starting point for an argument. Shannon and Weaver's (1948) Source → Message → Channel → Receiver model (SMCR) very clearly illustrates how early scholars conceived of messages as flowing directly to audiences. The receiver was the end-point. End of story. Traditional media organizations today may still consider this model to exemplify their industry to a large degree, though they certainly have had to re-evaluate the audience in the age of interactive media. As their audiences have eroded and migrated to digital sources of news and information, which allow for increased personalization, immediacy, and interactivity, SMCR is far too simplistic a model.

Furthermore, this work by no means discounts the more "traditional" audience work that defines an audience either as a passive receptacle for mass media or as a creative, thinking, and constantly negotiating entity, which transforms traditional media texts. Instead it invites readers to reimagine or renegotiate their own understanding of an audience, as well as the eroding distinction between traditionally defined senders and receivers of information and the blurring or merging of roles between these formerly distinct groups. I mean to suggest that interactive media are fairly different animals from traditional media, and they require a different kind of audience – or perhaps something entirely different from an audience altogether. Our vocabulary might have to change.

The earliest new media audience studies felt more like anthropological experiments in an uncharted foreign terrain, and few communication scholars thought of them specifically as "audience studies." Some of the earliest scholars were graduate students, and some of the key works were Masters theses; Rheingold, who wrote one of the earliest studies, was not even a traditional academic. Methods were primarily qualitative and specifically ethnographic, and they often fell in the realm of participant observation – methodology not so different from the more groundbreaking one used in traditional media audience studies on television and print audiences in the 1980s and 1990s. Early media scholars studying online audiences understood even then that their audience was something of a different animal, as it could immediately respond to any method of study. For one thing, the audience members often did not engage in the same "social" meaning-making with the texts before them, because they engaged in their online practices alone, sitting at a computer. For another, only a relatively small portion of the population actually had the knowledge and means to access these mediated online worlds. Often the research was written from a first-person perspective, as it questioned new sociological and cultural phenomena, to be found online within early text-based virtual communities known as MUDs – an acronym for "multi-user dungeon," which referred to various Internet-based forums – and MOOs – an acronym for "MUD, object oriented" (Bruckman, 1992; Dery, 1994; Kendall, 1996; Reid, 1995; Rheingold, 1993; Turkle, 1995) as well as newsgroups and listservs (Baym, 1993, 1995; Gurak, 1997). In this work, the authors demonstrate very clearly the agency that the audience is granted in its ability

to make sense of not only the content before it – as was generally the case in past mass communication audience studies using more traditional media such as books, television, film, radio, magazines, and newspapers – but also of the medium itself. These scholars used primarily a combination of participant observation, online interviews, and quotation, in their own research, of the audience's posted text. Their research often seemed to demonstrate the future possibilities and potential of the new media as much as to understand the audience that engaged with it.

In the early 1990s, in the pre-web Internet world, these studies were a marvel for anyone who saw “cyberspace” as a playground for identity play, anonymous protest, intellectual discussion, rhetorical advancement, and unfettered creativity in a space that provided a sense of equality through its disembodied anonymity. Several early audience studies on the Internet quoted the *New Yorker* cartoon of a dog sitting at a computer screen and telling another dog: “No one knows you're a dog on the Internet.” These early audience studies signaled to the larger community of media scholars that the new medium was a new space in which to find an audience, albeit a relatively small one. Still, the studies were not shy about extrapolating online socio-cultural phenomena to the real world. Rheingold wrote:

MUDs are living laboratories for studying the first-level impacts of virtual communities – the impacts on our psyches, on our thoughts and feelings as individuals. And our attempts to analyze the second-level impacts of phenomena like MUDs on our real-life relationships and communities lead to fundamental questions about social values in an age when so many of our human relationships are mediated by communications technology. (Rheingold, 1993, p. 146).

These early studies also signaled a shift in the very idea of what constituted an audience. Clearly Internet users – even those studied in research that measured and compared the effects of online media content and those of traditional media content – were able, at least to a certain extent – through emails, chatrooms, and rudimentary discussion forums – to respond directly to the gatekeepers who produced content and to other audience members. Furthermore, as the audience members came to understand better how to use the tools of the web and how to construct their own web pages, the already blurry line separating audience member from producer shifted completely. In order to grasp better a particular facet of the new media audience, scholars began to analyze the web pages they produced. For example, Stern (1999) conducted an analysis of web pages produced by adolescent girls, and she did so in order to gain insight into how these pages served to broadcast to the world the girls' innermost thoughts. This was a novel study of an audience, one that, at the time, was not considered highly technical, both because of stereotypes associated with gender and because it was years before Xanga and other personal blogging applications became popular among teens and tweens. In 2000 Hine's groundbreaking book *Virtual Ethnography* granted a stronger sense of academic legitimacy to the idea of studying audiences/producers online. Although ethnography is often seen as

a more immersive research approach to studying sociological phenomena, Hine suggested that online communities allowed for immersion and in fact were ripe for in-depth study that did not require the researcher to leave her office. As was the case in active audience studies, ethnography – even just in a virtual sense – became an accepted means of analyzing online audience members within their “native” environment.

Despite the generally accepted legitimacy of virtual ethnography, Internet audience studies in the early part of the millennium also signaled that there had been a change in that audience itself. As access to the Internet increased, and the web and digital media technologies became a more normalized part of the lives of millions of people worldwide, the studies no longer felt as though they were being conducted in a foreign land. People’s behavior and emotional response online was often studied as an extension of their offline behavior, which suggested that the Internet audience did not present the separate facets of its life in a vacuum; and indeed studies from Clark (1998) on teen dating and from Sveningsson (2002) on friendships and romances online showed that online social bonds sometimes extended to varying degrees into the offline world.

Additionally, studies suggested that audiences integrated their new media use into their daily routines – at work, school, and home; new media were no longer sites of pure play, or a laboratory for identity negotiation, as was suggested in the early 1990s. In an effort to analyze this blurring line between the real world and the online world, scholars such as Lewis and Fabos (2000), Ribak (2001), and Livingstone (2003) studied their “audiences” while they were engaged in using new media within their homes. More recently, Gray (2009) used a combination of online and “traditional” ethnography to explore the “public” and “private” spaces in which lesbian, gay, bisexual, and transgender teenagers in rural America negotiated “queer visibility” – from their hometown community centers, where they would have to appear in person, to Web forums, where they could communicate anonymously if they wished. Similarly, Clark (2003) combines Web and real-world ethnographic methods to study adolescents and spirituality. My own research on adolescent girls’ use of instant messaging with regard to gender and identity, which will be discussed later in this chapter, uses a similar, multiple-method qualitative approach to explore one active audience’s use of new media technology. Press and Livingstone (2006) regard this idea – recognizing that digital media are simply another part of the audiences’ lives – as a welcome new direction in new media audience studies, with the help of which the research could go beyond “virtual ethnography” to “internet ethnography” and begin “to contextualise interpretation of online texts (reception of what’s on the screen) in relation to consumption of a technological good in the domestic setting (in front of the screen)” (p. 17).

Research on audiences tends to evolve with the availability of digital media technologies. As more interactive tools emerged on both amateur and commercial web sites, scholarship borrowing from the methodological toolboxes of anthropology and traditional mass communication proliferated in order to address this “new” media

audience. Starting in the mid-1990s, most news and consumer-oriented websites included their own forum sections, bulletin boards, and community sections; but scholarship on online fans of entertainment programming and on their participation in virtual communities (or “fan boards”) was the most robust. In these communities, passionate communication among users and creative uses of digital media are rampant, which makes them a particularly interesting (and perhaps, unusual) site for audience study. Often focusing on identity articulation and the production of cultural artifacts, audience studies of Internet fan communities analyze discursive construction and interactivity both among audience members and between the audience and the text. For example, Whiteman (2009) and Williamson (2005) study online communities of fans of the TV series *Buffy the Vampire Slayer* and its spin-off *Angel* in order to reveal their negotiation of sexuality and gender identity; and Jenkins (2006) examines a variety of fan communities in order to better comprehend the role of the convergence between old and new media in producing hybrid (and sometimes, resistant) artifacts based on the *Harry Potter* series, on *Star Wars*, and on the US reality TV show *Survivor*. Costello and Moore (2007) used a web-based survey to learn how fans of various TV shows used the Internet to demonstrate how audience members were empowered by their ability to interact with one another and to act as “outlaw” fans, resisting the preferred narratives of shows, just as Ang and Michaels did working in person with fans of *Dallas*. These are only a few published studies in a sea of work on fan communities; but they demonstrate precisely how researchers could interrogate a traditional audience (“traditional” in the sense that the audience members watch television and movies) that functions very much like the theoretical “active audience” envisaged by Hall (1973, 1981). Additionally, this work supports the notion of an active – and often resistant – producer/audience member, an essential consideration in the study of the interactive new media audience. Hermes (2009), however, problematizes the consideration of online fan communities as “typical” audiences: “Fandom is appreciated for its specialized knowledge and affective investment, related to moods, feelings, and attitudes. Everyday media use, by comparison, is the lower form, which requires no other investment than fleeting attention,” she writes. “Fan studies are attractive and problematic in equal measure.” Still, she acknowledges that audience research, which considers its subject as an “empowered consumer-producer” within “mediated networks” – as does Jenkins in his 2006 studies on convergence and peer production – signals a new type of audience study, in which the audience members are not only contributors but also producers. This, Hermes says, is an important next step within audience studies in the new media environment.

Although this is most explicit in Jenkins’ work, other scholars have worked to make the distinction as well. For example, understanding the dynamics of bloggers and their audiences requires recognition that the audience is not only interactive but also productive. A blog, which could be defined as an easy-to-publish website that functions as a journal or personalized news site, provides tools to enable even the technically less inclined web audience members to publish their own musings and to attract audiences of their own. Largely characterized by its grassroots activism and

do-it-yourself ethics, the blogging movement captured both media and scholarly attention in the middle part of the previous decade (2000 to 2010). In *We the Media: Grassroots Journalism by the People, for the People*, Gillmor referred to the “former audience” in his analysis of what was happening as a result of increasingly interactive media online:

[T]he grassroots are transcending the pallid consumerism that has characterized news coverage and consumption in the past half-century or more. For the first time in modern history, the user is truly in charge, as a consumer and as a producer. (Gillmor, 2004, p. 137)

However, in the primary research conducted on blogs, most studies seem to focus on bloggers as gatekeepers rather than on the blog audiences, who contribute largely to the content within blogs (McGill, Iggers, & Cline, 2007; Steyn, van Heerden, Pitt, & Boshoff, 2007; Tomaszewski, Proffitt, & McClung, 2009). Few audience studies have examined both the blog’s founders/writers and its participants (apart from Carver, 2009 and a study of my own, which will be described later in this chapter), even though scholars have made clear that the audience – or the “former audience,” as Gillmor calls it – is what differentiates a blog from a traditional web page built with little or no capability for interactivity among users/audience members and the producers who created it. This becomes a more important issue for audience studies within the new media terrain of Web 2.0 and beyond, because the audience has added yet another layer to remind us that in fact it is still not an audience in the traditional sense.

The Audience Has an Audience (or The Audience is an Audience with An Audience)

With the immense popularity of social networking sites like Facebook and live micro-blogging services like Twitter, the meaning of “audience” must again be renegotiated and reimagined. Think of it as Audience 2.0 (Hermes, 2006). In this universe, new Internet applications and mobile devices make it incredibly easy for the audience to act as cultural producer on the fly (by writing and publishing whatever its members wish, to a very large audience of “friends”; by posting photographs; by commenting on others’ writing and posting). Not only is the audience/producer line still as blurry as ever; now the audience itself has an immediate, built-in audience that reads and views everything it, the audience, wishes to share. Furthermore, the members of this built-in audience are more aware than ever before that they are being watched in the new, interactive social media environment. In fact, being watched by – or, in the parlance of Web 2.0, being connected to – others is simply part of the attraction to using social media technologies; in

Twitter, part of the point is to be “followed” and to “follow” others as they post 140-character updates throughout the day. When a Facebook user posts a photo he has just taken from his phone to show the view from his hotel window on his vacation in Mexico, he certainly hopes to receive comments, or even just a small gesture of approval, as a Facebook friend hits the “like” button. When a Twitter user posts a link to an interesting article she read about her professional discipline in that morning’s *New York Times*, she hopes to be “re-tweeted” by many of her followers, thus increasing her own visibility in her community and sharing an excellent article with people who otherwise might not see it.

It is easy to get caught up in technical innovation, but Facebook and Twitter and their effects on audiences are not exactly the point. After all, new applications and services that we have not even heard of yet will certainly grow and dominate media stories and conversations in the coming years (no doubt you, the reader, will be already giggling at these references to Twitter and Facebook and thinking how far interactive media have come since this chapter was published). However, as scholars of the media, we should still observe changes in the audience as they are happening; and we can use the same methodologies and philosophical reasoning in studying the audience as we have from the time of the earliest audience studies.

Many scholars have called for changes in the way we consider audience studies in this most recent phase of Internet communication development. In his article “Participation, Remediation, Bricolage,” Deuze (2006) writes that, since people live in ways that increasingly connect, both offline and online, scholars should consider studying the various components of digital culture rather than focusing on one aspect of it. In considering how the new media audience may be studied for the “work” it produces, Napoli (2010) asks whether traditional mass communication research typologies can be applied in the study of such an interactive emergent environment. He calls for a “broadening” of the term “mass” as it applies to media, acknowledging that audiences must be considered both senders and receivers of mass communication. Hermes (2009) wonders whether audience studies are even appropriate in an era where “we are smarter as knowledge communities than as individuals” and “the wisdom of crowds stands in contrast to the strange mix of sophistication and naïveté that we find when talking with individuals” (p. 124). Ultimately, she believes that audience studies in the Web 2.0 era are still important because recognizing media power and agency is still important, and the researcher’s role can move from one of interpreter, storyteller, and theoretician to that of “coaches in media literacy” (p. 124).

Sundet and Ytreberg (2009) call for scholarship to withdraw from its conceptual work on “convergence culture” and to conduct empirical research in the tradition of active audience studies. Similarly, Press and Livingstone (2006) question whether a new paradigm of interrogation truly needs to be developed, suggesting instead that experience in studying traditional audiences could still provide a bedrock for the study of the new media audience; but they do acknowledge that online audiences present specific challenges:

To begin with, audience discourses and practices are more elusive because practice is often private – in the bedroom or study – making the audience researcher's presence even more salient than in the days of observing family television in the living room. Media engagement may be more transgressive or personal – including pornography, intimate conversations, personal advice, etc. And the use of media is harder to chart than in the days of mass communication – filling in a survey to record an evening's viewing is tricky, but by no means as tricky as recording and interpreting an evening's surfing or chat. (Press & Livingstone, 2006, p. 187)¹

Others go further – warning us that we should always look at our research questions in the sweep of cultural history, particularly because this will help us avoid getting too enamored of the wonders of the latest technologies (Spigel, 2001; Morley, 2006); in other words, we must realize that the telegraph provoked in its time many of the same dominant cultural discourses about progress and connectedness as the Internet does now (Standage, 1999). But these warnings can in effect end up discounting the Internet as a legitimate medium of study, and this would be a mistake. One does not have to be a technological determinist to note that millions of people are using the Internet in increasingly novel and interesting ways in this new millennium. Of course, we should recognize how culture has shaped technology (and vice versa) throughout history, but we should not discount the ways in which new media have generated new and revised forms of social relations.

In fact questions about the media audience in the interactive era are, arguably important, as the numbers of people with access to the Internet worldwide increase and social networking sites continue to outpace mainstream news sites in their number of visitors (according to comScore's statistics of worldwide unique visitors from June 2009, the top five sites included Google, Facebook, and Wikimedia Foundation sites like Wikipedia, while the only news-oriented site was CBS Interactive, the website for the US commercial television newscast, which was number eight; Schonfeld, 2009). The field of new media audience scholarship continues to grow and adds innovative work that does address the issues of the audience as producer and of the audience seeking its own audience. Researchers in this field use varied methodologies to get to the core of the interactive media audience; one is that of case studies – a methodology often used in organizational communication research, but less so in media studies research. For example, a case study by Russell (2007) examines how mobile digital media technologies were used by French youth to communicate what was happening in the 2005 riots outside of Paris; the same study also explores how various media outlets then appropriated these communications. Not only does the author employ an unusual methodology to study the audience; she also reveals a new facet – namely the audience acting as a producer tacitly aware of its own audience. This nuanced study uses Bourdieu's field theory (1993) in order to shed more light on questions of power, agency, and influence in the new media environment and to clarify the role of interactivity in shaping these questions. Carpentier (2009) uses the case study of a YouTube-like online platform in Belgium to illustrate the importance of social relevance and social relations in an

online participatory environment, while taking into account an audience that incorporates multiple layers of influence on production and reception. Carpentier ultimately argues that the traditional mass communication paradigm is not entirely discounted by new media audiences, which still seem to appreciate professionalism and the filter for social relevance that traditional gatekeepers provide.

Although case studies like these are useful in demonstrating different approaches to the audience as an *audience with an audience*, we should also heed Livingstone's (2004) warning against researchers becoming "melodramatic" in their bemoaning and romanticizing about the state of new media audience studies in an era when the media industry has become increasingly fractured:

Ten or so years ago, all was confidence and excitement in reception and then ethnographic studies, accompanied by ambitious talk of convergence of text and reader and, more grandly, of qualitative and quantitative methods, political economy and cultural studies, even social science and humanities. But soon after, the signs of dissatisfaction with supposedly celebrated, resistant, active audiences together with some of the supposedly flimsy methods used to research them, were loudly voiced and perhaps too readily acceded to, resulting in something of an exodus (of interest, of researchers) from audience studies as the field turned its attention to ever-newer media or other cultural phenomena. (Livingstone, 2004, p. 3)

In the next section I will discuss two studies of audiences in interactive environments that attempt to address some of the concerns expressed by Livingstone and others by using a multimethod approach to investigate the audience as it communicates both online and offline.

The Audience as Producer and the Audience That Seeks Its Own Audience

For those of us who have done qualitative primary research in the interactive media environment, "audience study" is a phrase that is rarely used – perhaps because of the complicated notions of "audience" that I outlined above.² However, the phrase can be reappropriated in many ways, in order to improve our understanding of how interactive media users are in fact an audience – albeit an active, hyper-aware audience. In my own research in this realm I have used multiple methods and theoretical frameworks to analyze this new audience's role as producer and consumer and as a doubly articulated audience. The researcher's work consists no longer in just interviewing and observing the audience as it reacts, or after it has reacted, to some particular media in a designated environment. The researcher must recognize instead that the digital environment is not the only environment in which the audience member is positioned. In the research I have carried out on adolescent girls by using

instant messaging (IM), the girls positioned themselves in particular ways in various online conversations with their peers, and in yet other ways in interview situations, away from the computer screen. Since my conceptual framework rested on Hall's (1996) idea that identity was always shifting and on Butler's (1990) notion that gender identity is performed through a series of repetitive acts that are imagined to constitute gender, it was imperative that I be able to view both of these aspects in my research participants, because different dimensions of their self-presentation signaled different aspects of their identity. Furthermore, identity itself was complicated by the fact that the girls' discursive construction varied from IM conversation to conversation, usually depending on whom they conversed with; and their tone and reactions in interviews with me differed from online to offline space. Furthermore, because I wished to incorporate the ideals of feminist ethnography – a field that attempts to place research subjects on as much of an equal footing with the researcher as possible – I was not comfortable asking the girls essentially to hand over every aspect of their lives to me, with little payment in return. (My university's Institutional Review Board agreed with this stance, incidentally.) Because of these complications, I settled upon a multipronged research approach. The adolescent girls would send me their IM conversations over a three- to six-month period, choosing on their own which and how many conversations to send to me. I would interview them in advance, in person whenever possible and over the phone when an in-person interview was not possible. As the research was underway, I would also contact them by email or IM for any clarification I needed, or simply to check in with them. This gave me conversations with a variety of peers chosen by the girls themselves to represent them – conversations that I could analyze as discourse (Gee, 1999), and it also gave me interview data culled both from an interactive mediated setting and from a traditional media or non-media setting.

Although the girls themselves did not differentiate aspects of their lives as “real life” or “online life” – which contradicts somewhat the data found in early audience studies online – I felt it was important to be able to see how the girls articulated gender and identity in a variety of settings. In virtual ethnography (Hine, 2000), the researcher may assume to a certain extent that those studied in an online community or setting might extrapolate their behavior to the “real world,” or they might believe that an intense, immersive study of subjects interacting in an online realm is a work of sociological research in its own right and that the Internet itself is a cultural artifact that deserves legitimacy. In general I agree with this stance. However, in media research in the era of Web 2.0 and beyond, it is imperative to observe and interact with those who are researched both as they use the Internet and (whenever possible) in face-to-face situations, if the researcher plans to make claims about theoretical concepts like identity. Perhaps this approach to online audiences marks me as a traditional social scientist, but the triangulation that can be obtained from the combination of oral/written and in-person/online conversations and interviews – in other words, from attempting to see the audience as producer and as active consumer – allows for a more complete picture of what is happening online. This combination

allows for a *bricolage*, a way to construct fuller meanings by combining a diverse range of objects in one's study in order to come to those meanings (Lévi-Strauss, 1966; Derrida, 1978; Deuze, 2006). Through bricolage, it is possible not only to see this new audience in its many forms and functions, but also to build upon the past research that theorizes the "traditional" audience as active.

Keeping in mind bricolage as a mode of triangulation, I used this approach in a very different piece of research, on a journalistic blog that covered news and events in a mid-sized Minnesota community called Northfield. In addition to functioning as a conventional blog, where one gatekeeper published his thoughts and musings about Northfield and included links and news of interest, the blog also incorporated some interesting and somewhat experimental reporting techniques, including the use of crowd-sourcing, or asking the blog's online audience to give input during the reporting process. In thinking about how I could construct as complete a case study as possible on the blog, I realized that it was as important to study the founder and the main blogger as it was to study the audience, which appeared to be quite loyal and vocal in its comments on the blog. I set up the study so that I could conduct a number of in-person interviews with the blog's founder – a local man who also had a talk show on the Northfield community radio station – as well as with its "official" contributors: a traditional news professional who was being paid through grant funding to work as a traditional reporter for one year; a copy-editor; and the founder's co-hosts on the radio show. This part of the study was something of an investigation into gatekeeping, or an attempt to understand both the intentional and the unintentional choices that producers made in crafting the blog.

However, in the blogosphere, the blog's readers break down these traditional "gates" (Gillmor, 2004), and it becomes important to think about this audience as an important producer and mediator of the blog's content through its comments and contributions. Because of this, not only did I study the stories and video clips posted by these gatekeepers, but I also analyzed the comments and responses posted by the blog's audience. In many ways these audience members appeared to be part of a cohesive community; they were able to converse with one another and to add insight to the conversations that started from blog postings (much of this claim is based on the fact that the blog focused on local news events and information, and the audience members primarily used their real names). Often the audience members would post additional information for the reporter, telling her that she should contact certain people to help with her stories or suggesting that she look at the archives of a local newspaper for more background on similar issues that the city faced years before.

Observing this reporter–source/gatekeeper–audience member dynamic was exciting for me as a researcher, but I felt limited in the claims I could make about the audience. Although a few audience members listed their full names – and even linked to their own web pages, Twitter feeds and personal blogs in their profiles – most of them used only first names, and there was no way to guarantee that these were their real names. However, I was presented with a unique opportunity to study this audience: in an effort to connect with the audience better, the blog's producers held a

townhall-style meeting at a coffee house in Northfield, and around twenty of the most “vocal” audience members showed up and participated in person. By attending this meeting and talking to many of the attendees (most of whom were regular participants and posters in the blog discussions), I was able to gather insight into feelings and attitudes that were not articulated in the online interactions on the blog.

Furthermore, I was able to clarify an important misconception that I had cultivated through my analysis of online texts. In the situations where the blog’s audience members were able to contribute to the reporting process, I (and the reporter who received the audience input) both sensed a general feeling of satisfaction, and even accomplishment, from the interactions as they presented themselves online. You could see this in the comments that would be posted after the story had been published as well (for example, congratulatory remarks like “Great job on the story!”). In person, however, when the attendees were asked about whether they valued the opportunity for this input – specifically in response to whether they would pay for a blog that allowed them to partake in crowd-sourcing in this way – almost all of them responded that they did not care about that part of the blog. Instead they said that they preferred the more traditional reporting models it used. Granted, as a researcher, one must question group behavior in this setting (for example, the reporter was present, and perhaps they wanted to make her feel good), but this personal, live interaction proved to be a crucial component in my analysis. (Interestingly, this finding supports the conclusion of Carpentier’s (2009) study on Belgian online video audiences, which was mentioned in the previous section.) Had I not heard the audiences’ actual, real-life voices in addition to their voices online, I might have made some incorrect assumptions in my research.

Moreover, this situation might also better illuminate a point made earlier in this chapter: that the audience is more aware than ever that it has an audience. On the blog, the commenters making suggestions and contributions to the reporting might have been doing so because it was an opportunity for them to publish to a far-reaching audience in a very public way, which usually is not afforded to non-journalists. Furthermore, after contributing to the stories, their posts to the blog would not be erased, even after the story was published. In this sense their contributions would also live online, perhaps for many years to come. When working “on the record” in this way, it is possible that an audience behaves differently. Questioning this behavior and the work produced by it is exactly the task of the new media audience researcher today. We realize that the audience is active, productive, aware of its own audience, and we should get to the crux of what this means with regard to media production and representation.

This revelation has forced me to re-evaluate the research I conducted on adolescent girls and on IM, which was done many years before the blog study, and also before social networking sites like Facebook had taken over the new media landscape (Facebook and MySpace offer their own versions of chat or instant messaging on their sites, though many adolescents still use other IM clients as well). One of the major findings in this work was that this particular mode of communication was an

interactive diary – a space free from parents and teachers, where identity could be articulated and gender could be negotiated through interactive conversations that might then be saved or printed for (private) posterity. However, these conversations sometimes were pasted within other conversations and passed along to other peers – sometimes recopied and pasted and passed along to the entire student population at the participants' schools and beyond. In my analysis I could not help but think about the girls as being somewhat naïve about the blurring of private and public space, as they hashed out their personal lives in conversations that they thought were private. However, in considering this particular audience, I did not give enough credence to the fact that – as members of a generation so cognizant of being constantly watched, surveyed, and under surveillance—privacy had become less meaningful to them than it might have been to me, and perhaps to my generation (Generation X) and previous generations. In my current research about adolescent girls and their use of Facebook – which includes the comments, the photos, the status reports they post to make them seen by their “Facebook friends” – it looks as if being watched, or the *potential* of being watched, by one's peers is in many ways the entire point. Considering the prevalence of social media in their lives and the presence of reality television programming on every network, it did not surprise me to hear the girls I studied express little expectation of privacy and confidentiality.

Toward the end of my IM study I conducted follow-up interviews in my analysis, with the hope of being able to catch these kinds of nuances; but, by the time the analysis was finished and the conclusions drawn, the girls were older by two years. Their preferred online technologies had changed in that time; many had moved exclusively to social networking sites to communicate with peers. Furthermore, in the life of an adolescent in a study of identity, this often means that the audience has changed so drastically that its members do not even recognize themselves in their own work; and that was indeed the case here. “I don't even use IM anymore now that I'm a junior (in high school),” one girl told me. “I think a lot of that stuff is just funny now, but I really was into it back then.”

Part of the challenge lies in the fact that new media will always be new, dynamic, and changing, and, as Livingstone (2004) noted, the academic publishing community might have a tendency to embrace too quickly whatever new media is newer and, along with that new media, the audience that follows it. In 2010 IM is decidedly “old,” and the earlier studies on MUDs, MOOs, listservs, and newsgroups are considered ancient history. While insight into the changing interactive media audience could certainly be gained by revisiting this work and by using it to illuminate the cultural context of a world that has reached the point where social networking sites are part of people's daily lives, this type of audience work would now be relegated to historical journals.

The ever-changing landscape of new media takes us back to the point of departure of the chapter: to Magritte's inscription about the pipe, and to my own parallel statement about the audience. Within Web 2.0, audience studies researchers must now consider an environment where Hall's (1973) explanation for the processes of encod-

ing and decoding within media texts is skewed. Through interactive and social media, encoding and decoding take place simultaneously rather than in two separate steps. Both producers and audience members are regularly executing such meaning-making tasks. This return to the original understanding of the audience as an “active” entity has been cited frequently by scholars over the past decade, in essays about the study of interactive media audiences. Certainly, in their work over the past 15 to 20 years, many – especially those who authored the studies explored in this chapter – have grasped the implications of a growingly active and productive online audience. After all, the fact that the audience may no longer be an audience at all, or that it may be a new “super-audience” instead (that is, an audience with an audience with an audience . . .), speaks to the potential need for an entirely new label for this genre of research. Moving forward, we must question not only the interactive media audience’s dual role – as producer and audience – but also what it means that this audience is constantly aware of its new role and of its creative potential.

Ce n’est pas un public – indeed.

NOTES

- 1 Livingstone practices this nicely in a different piece of research on adolescents and social networking sites (Livingstone, 2008), where she interviews 16 teenagers in their homes while they demonstrate what they are talking about by showing her their MySpace, Facebook, and Piczo pages.
- 2 When I asked a colleague whether I could refer to one of her studies on blog audiences for a chapter I was working on about new media audience studies, her reaction was: “I didn’t conduct a survey for that article. That’s what you mean, right?”

Counting, and Accounting for, Online Audiences

Fernando Bermejo

ABSTRACT

Audiences rarely define themselves. Rather, they can be considered to be the product of research procedures implemented by media/advertising industries and by academics. In spite of the evolving nature of these research procedures – which is due to methodological variations, market competition, and paradigmatic disputes – there existed in past decades a certain degree of consensus on how to count, and how to account for, media audiences. This fragile consensus has been challenged in recent years as a result of the prominence achieved by online media. In consequence, the media/advertising industries have had to reconsider measurement procedures in order to adapt to the characteristics of online media and audiences, and even the very nature and necessity of measurement has been questioned. In turn, academic researchers have had to reconsider their conceptualization of audiences, to the point of putting into question the very idea of the audience. The present chapter examines this dual attempt at reformulating the ways in which audiences are counted and accounted for in the context of online media.

The concept of the “audience” as it is commonly used today belongs to a set of ideas that refer to human collectivities.¹ In spite of this, the collective nature of the audience is rarely expressed directly. This is, of course, a historically bounded assertion, since, as Butsch (2000) has shown, the behavior of the audience as well as its capacity to express itself as such have starkly changed over the past three centuries. The audience of live performances,

which dates back to antiquity, “was localized in place and time. An audience occupied an ‘auditorium,’ a space in which to hear and see what was going on and to respond directly” (McQuail, 1997, p. 3). It was thus able to perceive itself as a collective and to act as such. However, when technological devices were inserted into the communication process, physical co-presence ceased to be a necessary element of audiencehood, and immediate collective reactions became a much rarer occurrence.² In fact, the evolution of the mass media up to the late twentieth century can be described as a progressive separation from the lively audiences of performances (Butsch, 2000). If we consider the mass media that have been the dominant form of public communication throughout the past century, we can observe that the audience of those media hides in the privacy of media consumption,³ each member being disconnected from other members of the collective⁴ and only rarely asserting his or her own reality as part of an audience and acting upon it.⁵ In the era of mass communication media, the audience is for the most part the result of the defining work of others.⁶ And the audience measurement industry and the academic field of audience research are the most significant others generating definitions of the audience.

With the prominence achieved by online communication since the 1990s, both the audience measurement industry and the audience research field have faced the need to reconsider their tools and their concepts in order to keep providing those definitions. And this reconsideration has direct consequences on the institutional dynamics of the media, on the configuration of communication studies, and, ultimately, on the very reality of the media under study and of their audiences. And this is so because, for decades, the depictions of the audience provided by audience measurement have played a pivotal role in the economic and institutional dynamics of the media, especially in broadcasting (Ang, 1991; Napoli, 2003); because the field of audience studies has become in recent decades one of the most dynamic areas within communication research and conceptualizations of the audience have constituted a fundamental element of most communication theories (Allor, 1988); and because the way in which different social actors – from policymakers to media professionals and owners – conceive of and act upon the media depends to a large extent on the definitions of audiences that are available to them.⁷ In order to understand the changes triggered by the advent of the Internet as a relevant form of communication in these defining practices, the present chapter offers an analysis of the evolution of audience measurement in the online environment over the past 15 years – in others words, of the counting of online audiences. This analysis will in turn allow us to examine how commercial audience measurement may influence academic conceptions of and discourses on audiences – which can be considered modes of accounting for online audiences.

Counting Audiences

The practice of counting audiences, or audience measurement, has played an essential role in the economic and institutional functioning of the mass media for decades, and

it has been closely linked to the use of advertising as a media business model.⁸ This practice can be conceived of as a subset within the field of market research, which, in turn, can be considered as one of the different forms of control exerted over collectivities that characterize modern societies and nation-states.⁹ However, the shape and relevance of these techniques of control have evolved over the decades, in parallel with the evolution of dominant technologies and modes of communication.¹⁰

As a form of control, audience measurement shows an almost paradoxical nature, since usually it is more necessary when its implementation seems more difficult. The origin of this paradoxical situation can be traced back to a large extent to the ways in which the degree of control over access to communication can orient different media technologies toward specific business models. In modes of communication in which there is a clear spatial component – such as live performances or theatrical film releases – it is usually simple (1) to demand some kind of payment in exchange for access; and (2) to calculate the size of the audience either by counting ticket sales or simply by counting the people in attendance. In fact, in these communicative modes, advertising often plays a secondary role – if any – and there is little need to implement a specific and complex mechanism for measuring audiences. In modes of communication where there is no access to a particular space that can be controlled but there is a physical container – such as a book or a disc – that holds information, it turns out to be relatively easy (1) to demand some kind of payment in exchange for the physical container; and (2) to come up with a rough estimate of the audience from the number or copies sold. Again, in these modes of communication reliance on advertising tends to be low, and estimates of the audience are easy to produce – even if they are not exact, since the precise relation between the number of copies sold and the actual size of the audience is often unknown.

Broadcasting, on the other hand, offers an obvious contrast with the modes of communication described above.¹¹ In broadcast radio and television there is no space to which access can be restricted, and there is no physical container that holds the information. Thus it turns out to be rather difficult to demand payment in exchange for content. As a result, advertising turns out to be an almost natural business model for broadcasting.¹² And, for advertising to flourish, it is necessary to know the size and profile of the audience. But, since there is no physical space in which to count audience members and no transaction record from which to infer audience size, there is a strong need to develop specialized and complex forms of audience measurement – hence the relevance of audience measurement in broadcasting.

The online environment is rather peculiar in this regard. First, pay-models have not been easy to implement in the online environment and advertising has become a very relevant source of revenue – which, in turn, opens the door to audience measurement efforts.¹³ Second, even if control over access to communication products is not always possible, online communication leaves a trace, and there is always a record of the connection between senders and receivers. However, this record is so complex, so difficult to clean and analyze, so open to errors and omissions, that it requires deploying elaborate measurement strategies to estimate the size of the audience.

In fact the birth of the field of online audience measurement can be dated to 1995: it coincides with the advertisers' increasing interest in new communication technologies such as interactive television and the Internet. During the first years of the 1990s the Internet underwent a profound transformation and, while preserving most of its structural and defining traits, it became a very different network from the ARPANET, from which it grew.¹⁴ In those years, three related processes took place that help explain the birth of online audience measurement at that particular juncture. First, the Internet underwent a process of privatization and commercialization. All the different areas of the Internet's management and infrastructure were transferred into private hands, and commercial interests became a staple at all levels of online communication – from the actual telecommunication backbones to the content and services provided online; from the software necessary to connect to the net to the actual connectivity through Internet service providers. Second, the Internet became a mass medium in terms of the number of its users. For the first time, online users could be counted in the dozens of millions, and for a few years in the mid-1990s the number of Internet users worldwide more than doubled yearly. Third, asymmetry became a feature of online communication due to the introduction of a communication tool – the World Wide Web – that was basically unidirectional.¹⁵ The popularization of the Internet in the mid-'90s was due, to a great extent, to the advent of the web, a tool that made it extremely easy to consume information published by others but did so at the expense of becoming, at least for a few years, a medium in which content was published by a few and consumed by many (Roscoe, 1999). In this environment of commercialization, popularization, and asymmetrical communication, it is no surprise that the advertising industry became interested in online communication, since these were the same defining traits of the environment where it had thrived for decades: the traditional mass media.¹⁶

The first advertising banner appeared in 1994. At that moment, online publishers and the advertising industry understood that online advertising could become a significant source of revenue for all, and that this would only be the case if an online ratings system was set in place (Turow, 1997). As a result, starting in the spring of 1995 and in the space of only a few months, several companies and organizations decided to implement different procedures to measure online audiences. The online audience measurement industry had been born.¹⁷

Measuring Online Audiences

The online audience measurement industry created in the mid-1990s was clearly shaped by three main forces that conditioned its form and evolution. First, the general institutional framework from which it grew called for measurement efforts able to produce data that could serve as a coin of exchange in the trade of audiences constituting the core of the mass advertising business. This general framework

required, as had been the case in the measurement of the audience of previous mass media, data on audience size and composition of the audience of specific communication vehicles. Second, the new industry did not grow in a vacuum, but in the context of an established audience measurement industry that had for decades played a very relevant role in the functioning of the mass media. This ratings industry had structured itself around the model of independent third-party organizations that were able to reconcile the conflicting interests of the different stakeholders in the audience market (Miller, 1994). These organizations established a form of measurement that revolved around the idea of exposure to specific communication vehicles – what was actually measured was the number of people who had been exposed to a particular communicative product; any other objects of measurement were ignored for the most part. On top of this, the audience measurement industry had accumulated a great deal of methodological know-how that could be put to use in the measurement of online audiences (Webster, Phalen, & Lichty, 2000). In particular, the industry had focused on developing combinations of sampling methods and sophisticated data collection tools that could satisfy the demands of rigor among sellers and buyers of audiences. Third, while the general institutional framework and the legacy of the existing ratings industry pushed online audience measurement toward a line of continuity with previous forms of measurement, the new industry was confronted with a medium that presented rather novel technological features and generated distinctive patterns of use. If these evolving methods of measurement could not be properly adjusted to the new context, the whole established commercial institutional arrangements surrounding the counting of audiences could be put into question.

The persistence of the institutional framework demanding a coin of exchange for the audience trade was guaranteed by the determination with which the advertising industry promoted the development of online audience measurement in the second half of the 1990s. Led by Procter & Gamble and other large advertisers, and with the support of the main trade associations, the advertising industry facilitated the creation of different coalitions and organizations aimed at promoting and shaping online audience measurement. Through the Coalition for Advertising Supported Information and Entertainment (CASIE), the Future of Advertising Stakeholders (FAST), and the most lasting and influential Interactive Advertising Bureau (IAB), advertisers and, to a lesser degree, publishers attempted to fuel the online advertising industry through the development of standards and best practices that could be adopted by all participants in the audience trade. In turn, the legacy of the preexisting audience measurement industry has manifested itself through the role played by many of the established measurement organizations in the development of the new sector and through their attempts at becoming the independent third-party of reference by improving on existing methods and/or acquiring a position of market dominance.

But, in spite of general continuity in the measurement effort in terms of aim, logic, and procedures, online audience measurement had to adjust to some specific

traits of the new environment in which measurement operations were being implemented. The Internet as a communication tool presents obvious differences compared to previous media, and some of those differences have direct consequences on the particular forms measurement should take if it has to perform the role that is required of it. In particular, it should be noted that the Internet is an intrinsically global medium; it is a medium that is not bounded to the home, and it is regularly used from multiple access locations; it is neither a flow – like radio or television – nor a closed product, like print publications; it leaves a trace of every transaction of information taking place over it; it presents an endless number of communicative vehicles; and it can be accessed from a multiplicity of platforms (Bermejo, 2007).

These peculiarities explain, in turn, some of the problems and limitations of the different methods that have arisen to assess the size and composition of online audiences. In this sense, when the industry started to develop online audience measurement initiatives, two main routes seemed to be at its disposal. The first route entailed the adaptation of the measurement methods already in use in the audience ratings industry, in particular surveys and panels. The second route involved the development of new tools, which were based on the use of the records left behind by online transactions in order to estimate the size and profile of the audience – these took the form of log-file analyses and tag systems. Both routes have been followed by different measurement operations since the mid-1990s, and surveys, electronic measurement panels, log-file analyses, and tags have all been part of the measurement panoply used by the industry. However, all these methods have shown obvious shortcomings in their attempts at measuring online audiences and none has been able to become the standard of reference.¹⁸

Surveys – defined as the use of standardized questionnaires to collect information from a representative sample of a population – have traditionally been an essential pillar of the processes of audience measurement, particularly in the measurement of those media that do not easily lend themselves to the use of automatic devices attached to receivers in order to collect information on usage – mostly print publications and, for most of its history, radio.¹⁹ However, when they have been used to measure the audience of online media, their limitations have only been accentuated. This has been the case both because of sample size demands and because surveys essentially depend on interviewees' memory and sincerity –neither of which can be easily relied upon when measuring online audiences. The larger the number of vehicles – radio stations, television channels, websites, and so on – that need to be measured, the larger the sample required to offer stable data from all the different vehicles. If the audience is scattered across many different options, those options that attract a small portion of the total audience will face larger margins of error and high variation across subsequent measures of their audience. Due to the huge number of possible options available online to capture audiences' attention, this issue turns out to be particularly relevant, and surveys need to have sample sizes that are not always possible or viable in practical terms. In addition, the expectation that

online users will remember, and be able to recount, all the different websites they have visited and to specify how much time they have spent in each and what they have done while there is simply unrealistic. Likewise, expecting that survey interviewees will be willing to share with interviewers the details of all their online activity does not seem sustainable. As a result, surveys have played a marginal role in attempts at measuring online audiences. They have been used, for the most part, to estimate the global size of the online population and to understand macro-level issues such as frequency of use, speed connectivity, location of use, and so on. But they haven't been able to provide relevant data on the size and composition of the audience of specific online outlets.

The essential difference between panels and surveys lies in the use of samples. While in surveys the population sample from which information is gathered is normally used once, in panels the same sample is used over time to collect information on subsequent occasions, thus providing a longitudinal view of the evolution of the variables being measured. In their implementation for audience measurement purposes, panels are usually associated with the use of metering devices; while there are panels that use diaries instead of meters to collect information from the members of the sample, measurement operations that use meters are almost by default panels, since it does not make practical sense to install meters in a sample in order to gather information from it just once. As such, panels have been the dominant technique for the measurement of the television audience through the use of "audimeters" (that is, meters for audience measuring). And, since television panels have been, for decades, socially and economically the most relevant form of measurement, it seemed only natural to apply the same model to the online environment when the need to start measuring the Internet audience became apparent (Buzzard, 2003). The only significant difference in the implementation of panels has derived from the different nature of metering devices. While in broadcasting the meters have always been a piece of hardware attached to radio and television receiving devices – and, most recently, carried around by members of the sample being measured – in the online space these meters take the form of software tools that can be installed in computers to monitor online activities.

However, when used to measure the online audience, panels have faced three main hurdles that were not present – at least not to the same degree – in television measurement. The first one, as is the case with surveys, has to do with the size of the sample and the need to draw very large ones in order to cover a significant portion of the number of available online vehicles. Traditional online panels have offered statistically significant data for only a few hundred websites – often less than 300 – which represent a very small portion of all available websites.²⁰ The second hurdle faced by online panels has to do with the geography of online use. Audience measurement panels have usually drawn their samples from national populations. This means that the audience they measure is circumscribed to specific national borders. And, while that might not have been a relevant issue when measuring broadcasting

audiences – in spite of the international reach of some of its vehicles, broadcasting has traditionally been bounded to national borders – it actually turns out to be rather significant in dealing with such a transnational medium as the Internet. As a result, online measurement panels have been unable to measure the portion of the audience of online vehicles that are located outside the country where the panels are deployed. The third main hurdle faced by online panels has to do with the different patterns of media consumption. While television, the medium in which panels have achieved an indisputable success, is clearly tethered to the home – television consumption has traditionally taken place in domestic spaces – that is not the case with the Internet. If an online panel wants to measure the online audience, its sample cannot be limited to homes but has to take into account work spaces and “third places” – cybercafés, libraries, community centers, and the like. This has proven to be – in spite of significant efforts – an insurmountable hurdle for online panels. It is almost impossible to draw a representative sample of computers connected to the Internet in places other than homes and, even if such a sample could be drawn, it would be very difficult to deploy due to general resistance from companies and organizations to installing metering devices in their networks’ computers. In spite of these obvious limitations, online panels have been widely used over the last 15 years or so, as a source of data on online audiences.

But, besides other methods already used in the measurement of previous media audiences, the Internet offers an alternative route that is not open to other media. Online activity generates endless amounts of information that is constantly recorded, stored, and analyzed. This information can help in measuring online audiences, and two main techniques have been used to take advantage of it. The first technique is usually referred to as log-file analysis. Log-files are text files that are automatically generated by Internet servers; these files record the activity generated by requests to them. They store information such as Internet protocol (IP) addresses from which requests are made, cookies in the users’ browser, browser type, operating system used by the client, time stamp, and so on. But, while the richness of this information is unquestionable, measuring online audiences through the analysis of log-files turns out to be a rather complex process, fraught with technical problems, imprecision, and limitations. However, besides the fastidiousness of the cleaning and analyzing process, perhaps the main problem with the use of log-files for audience measurement purposes has been the inability to link the data recorded on online activity with individual users in a consistent and precise way, and the impossibility of deriving a clear demographic profile of those users.²¹ The use of tags, tiny invisible markers and code inserted in web pages that allow for the collection of information similar to that stored by log-files, has facilitated the automatization of the analysis, but it has not been able to overcome limitations in connecting activity with users.²² This means that the analysis of the records of online activity has serious shortcomings when it comes to offering an exact quantification of the size of the audience and a detailed profile of its composition.

Casting the Role of Measurement

Besides – and partly because of – the difficulty in adjusting the measurement process to the peculiar characteristics of the online environment, audience measurement has also been confronted with a transformation in its institutional role within the field of online commercial media. In broadcasting, ratings constituted an essential pillar of institutional arrangements: they guided most programming decisions, shaped the internal functioning of the media, and determined their financial success.²³ The extensive power held by ratings derived from the role they played as the fundamental piece of information that shaped advertisers' relations with the media. Ratings provided advertisers with (1) the guarantee that they were receiving what they were paying for;²⁴ and (2) the information necessary to target their ads – in terms of audience composition.²⁵ However, the online environment offers a much more complex picture.

In this scenario, measuring the size and profiles of an audience remains an important activity, but it does not occupy the central role that it held in broadcasting. The reasons for this are multiple. Of course, the difficulty in measuring the online audience analyzed above makes it harder for the results of the measurement to be accepted as a common currency in online economic exchanges involving advertising. A decade and half after its birth, and in spite of a process of consolidation, online audience measurement does not show signs of achieving the stability that the ratings industry presents in other media – there are competing measurement operations, competing methodologies, and competing general approaches to measurement. Besides this, the very diverse shapes taken by online communication and the many different business models that sustain them contrast with the relative homogeneity of previous media and business models, making it more difficult to find a common point of reference from which to explain the economic logic of the medium and to refer to an anchoring institutional arrangement. In this context, audience measurement seems to have lost its centrality in the institutional arrangements of the media in their online transition, because new forms of managing and targeting advertising have emerged – such as search-related and behavioral advertising – that seem to comply better with the characteristics of the online environment while being able to function without any audience measurement as such; of course, other types of data collection practices are necessary. Flaws, disputes, and competition in the measurement process are not in themselves enough to dethrone established institutional arrangements. As Napoli (2011) has pointed out, a viable alternative to these arrangements needs to be available if significant changes in the existing order are to take place.

In order to understand the viability of these possible alternatives to the system of trading audiences that is based on data provided by the measurement industry, some general dynamics of the online environment and of the online advertising management process need to be examined. There are, in particular, three specific characteristics of the online environment that seem to shape the evolution of online advertising and to influence the relevance of measurement:

- 1 *The Internet Leaves a Trace:* As pointed out before, a record of online activity is routinely generated and automatically collected as part of the activity itself. And if this record can be used as the source of information for targeting ads – and not necessarily in the form of audience measurement – there is no need to devise and implement complex and costly data gathering procedures for the advertising market to flourish.
- 2 *The Internet Affords More Interactivity Than Any Other Communication Medium:* While previous communication media were for the most part unidirectional and their usage flexibility was rather limited, the Internet allows for endless forms of user activity: reading, viewing, clicking, writing, playing, purchasing, and so on. This means that the restriction to exposure as the key piece of information for managing online advertising does not account for the complex relationship between media and users. Thus, and in combination with the above, huge amounts of information about audiences, derived from the many different forms in which they interact with the medium, can be easily and automatically collected and then used in the process of targeting ads.
- 3 *Over the Internet, Ads and Content Are Managed Separately and per Request:* There is no necessarily predetermined link between specific ads and specific communicative products, nor between specific ads and specific users. That is, every online request can return a different ad, breaking the traditional relationship between media outlets and advertising – in which content, ads, and audiences were bundled in a comprehensive whole.

If we look at these three issues in reverse order, we can say that, while the traditional form of managing the advertising process was based on the implementation of complex measurement procedures that sampled portions of the population to assess the exposure of select groups of individuals to specific communication vehicles, in the online context (1) there is no need to measure specific vehicles – since the content has been unbundled and advertising can be managed by individual requests; (2) the idea of exposure constitutes but a tiny fraction of users' engagement with the medium – it does not cover most of the interactive nature of the relationship; and (3) information can be collected on all users – not only on a sample of them – by simply capturing and analyzing the trace left by online interactions. Taking this into account, it seems easier to understand how traditional forms of audience measurement may be losing their central role in the context of online communication.

If we examine the evolution of online advertising over the past decade, it is possible to see new forms of advertising – such as search engine and behavioral advertising – that have gained increasing relevance and have adjusted to the three characteristics described above without demanding audience measurement – at least not in the way in which it was developed in broadcasting, or even in the first years of online measurement. Search engine advertising is based on the keyword searches of users seeking answers to their queries. Both because of the particular relation of users to the search process – they are looking for something – and because their

interests, wants, and desires are expressed in relatively concrete and concise terms, using those keywords as a way to link users and ads has turned out to be a rather effective and lucrative way of managing online advertising (Bermejo, 2009). Thus search engine advertising utilizes information provided by users – not captured through any additional data collection process – that goes beyond exposure – users are not exposed to content, they are searching for it – and these specific quests for information are used to target individual users – there is no longer a need to target a collective or a mass/undifferentiated audience.²⁶

Behavioral advertising is based on the collection of information concerning all possible online activities of users, a collection that is made in order to create an individual profile of each of those users; and this profile serves as the key piece of information to determine which ads are going to be displayed. Of course, the system is not perfect, and it faces problems such as the ability of users to delete or reject tracking devices, or the issue of multiple users per machine and multiple machines per user. However, it is becoming a regular form of managing online advertising and, again, it does not require any form of audience measurement because it relies on routinely collected information that individual users generate automatically. Behavioral advertising targets specific users at specific moments in time.

Accounting for Audiences

The adaptation of audience measurement to the online environment appears to face significant challenges and seems to be on its way to losing the central institutional role it has played for decades. We could surmise that this situation does not significantly affect the process of accounting for audiences, which lies at the heart of audience studies. Because the evolution of audience measurement presented here has a direct impact on a specific subsection of communication media – online media – and seems to be relevant largely for commercial audience research, we might be led to conclude that audience studies in the academy can remain unaltered and linger at the margins of these developments. On the contrary, I would like to argue that the situation described here actually has a direct influence on the field of audience studies, and I will do so by addressing six related issues.

First, even if we were to argue that the dynamics examined above are circumscribed to the online environment, the increasing relevance of online communication should make us wonder about the actual reach of these phenomena. The dominant forms of public communication at particular times in history have often exerted a strong influence over the general understanding of audiences (Neuendorf, 2001). In this sense, the overwhelming dominance of television as the medium of reference throughout the second half of the twentieth century has clearly shaped our understanding of audiences, our ways of accounting for them. It would be naïve to think that television has lost that central place in society in general and in audience studies

in particular. It would be equally naïve to think that this is going to be the case for very long. The rapidly growing relevance of online communication should lead us to consider the possibility that the specific dynamics of a subsection of the media in the current situation today might well transform tomorrow into the general overarching trends of media communication.

Second, even though the crisis underway in audience measurement seems to have its epicenter in the context of online communication, the truth is that its consequences have been felt across the board in the audience measurement industry. Although the history of commercial audience measurement includes frequent struggles over methodological procedures, market dominance, and the validity of measurement results, the general approach to measurement and its pivotal role in the economic functioning of commercial media has remained unquestioned. Currently, however, the problems that online audience measurement faces seem to be spilling over into all forms of measurement, and we are now witnessing a general questioning of audience measurement across all media (Turow, 2006). Considering the reverberations in other parts of the media world, it seems difficult to maintain that the issues discussed above only affect a small section of communication media. Rather, they are shaking the whole audience measurement industry.

Third, even if the two previous points were well taken, and we accepted that the situation examined here affects directly those forms of media communication that are on their way to becoming dominant and affects indirectly all other forms of commercial media communication, it still could be argued that this is not an audience studies' problem. After all, academic approaches to studying audiences have followed a different logic from commercial ones, have often used different methods, and have produced very distinctive views of the audience. However, we should consider Mosco and Kaye's (2000) assertion that "it was not until broadcasters needed to determine the actual size of the unknown audience that the analytical objectification of the audience began [. . .] eventually bequeathing to the field of mass communications an analytical category loaded with meaning" (p. 35). It is obvious that, once the concept entered the field of communication, it took on a new life, independent of the commercial interests from which it was derived. But, if the field of mass communication inherited the concept of "audience" from commercial research, and commercial research seems to be heading in the direction of discarding it as a useful way of understanding new media, we should at least wonder whether we want to keep using a concept when the field from which it originated does not seem to find a use for it any more.

Fourth, even though commercial and academic audience research have followed very different – often opposite – paths in terms of goals, methods, and results, ratings have a long tradition of being a source of data for academic audience research. Researchers of mass communication have explicitly relied on industry audience measurement sources to study media audiences, from the inception of radio (Beville, 1940) and television (Stavitsky, 2000) to the web (Webster & Lin, 2002). Given this fact, the influence of audience measurement data on academic research is not merely implicit and diffuse. To the extent that the nature of our knowledge of audiences is

changing, the types of questions that can be answered using old conceptions of audiencehood will also change.

Fifth, if we examine the evolution of audience studies over the past few decades, we can see that academic research has moved in the direction of seeking a more nuanced view of the constitution of audiences and of the meanings of audience activity. Scholars have argued that the mere counting of audiences acts as a form of control that reduces the complexity and richness of those audiences to mere data on exposure. To the extent that commercial research moves beyond the idea of exposure and in the direction of a more detailed depiction of audiences' practices, perhaps there may be increasing possibilities for collaboration and mutual understanding. This is what Napoli (2011) refers to when he says that the evolution in the field of audience measurement may represent changes in the relevance of different forms of inquiry in audience studies "and, perhaps most interesting of all, an opportunity for bridging gulfs that have developed between academic traditions and between academic and industry researchers." We need to acknowledge, though, that, in spite of this increasing possibility of convergence, the difference in goals and approaches will no doubt keep commercial and academic research in different camps, as contrasting and independent modes of studying and understanding audiences.

And sixth, over the last couple of decades, multiple traditions of research within the field of audience studies have been questioning the reality of the audience, and even the concept of the audience itself. Perhaps it was Allor (1988) who first explicitly stated this line of reasoning when he said that the "audience exists nowhere; it inhabits no real space, only positions within analytic discourses" (p. 228).²⁷ Thus, throughout the 1990s, a succession of authors began the discursive process of eroding the audience as an ahistorical abstraction or a naturalized concept. But before we decide on the demise of the audience as an analytic category, we should consider that the audience has had a long history of adaptation to new phenomena, an adaptation process that points to its resilience and flexibility. The concept of "audience" has changed from being applied to communicative situations in which there is a physical co-presence to other situations, in which technological mediation allows for communication at a distance; it has gone from referring to the act of hearing – whence its etymology (derivative of *audire*, "to listen" in Latin) – to encompassing the act of watching, or even reading (Radway, 1988). Thus, before we can herald the end of the audience as a useful academic or commercial heuristic, perhaps this discursive erosion and questioning needs to be paired with significant changes in the communication environment. The increasing relevance of digital and interactive forms of communication may actually offer the kind of change that encourages a productive engagement with the utility of the audience as a concept. While this history of conceptual adaptability might indicate that we are just witnessing a new expansion in the uses and meanings of the word "audience," it seems necessary to remark that across all of its past incarnations the only element that has remained stable in the situations to which the word refers is the fact that there is a clear separation and asymmetry between senders and receivers – from popes and kings who confer the status of

audience to lay people and subjects, to media organizations that produce content for the consumption of the mass audience. As Angus (1994) stated right before the Internet started to achieve its current relevance, in the most significant contemporary communication systems “audiences tend to remain simply audiences; that is, communication systems tend to sever audiences from reciprocal production of social knowledge and engagement in decision making” (p. 233). However, online forms of communication allow for the dissolution of that asymmetry and thus may break with the only trait of continuity in the different incarnations of our models of the audience. Online audiences often do not remain simply audiences. Still, the perfect symmetry and interchangeability between senders and receivers remains a counterfactual ideal in most communicative contexts, and there remains, for example, a clear difference between those who create and manage an online social network and those who take part in it as users. In the online context, asymmetry and power relations take a new, different form. However, the erosion of asymmetry in online forms of communication should at least make us wonder whether other concepts can better account for these new communicative realities. And it might well be that the general crisis that audience measurement is undergoing will serve as the final impulse needed for jettisoning our attachment to the concept of the audience. If that is the case, perhaps the same practices and the same modes of communication that the audience measurement industry seems unable to tame may serve as the source of inspiration for devising new ways of accounting for the relationship between people and their media practices of reading, watching, browsing, using, producing, and consuming.

ACKNOWLEDGMENT

I would like to thank the “paper working group” at the Berkman Center (in particular Hal Roberts, Wendy Seltzer, David Ardia, and Donnie Hao Dong) for their constructive comments on previous versions of this chapter. My residence at the Berkman Center was partly made possible by a José Castillejo grant awarded by the Spanish Ministry of Education.

NOTES

- 1 Perhaps it could even be included within what Herbert Blumer (1951) called “forms of collective behavior.” See, for instance, Long (1994) for a use of the concept of “collective action” to analyze the practice of reading.
- 2 Writing can be considered to be the first technological device inserted in the communication process. The printing press was the means through which the technology of writing achieved an unprecedented social relevance, and it is often taken as the starting point for the history of modern communication technologies.

- 3 As Livingstone (2003) put it: "With the shift away from visible and audible participation by live audiences, the activities of the new, mass mediated audiences became highly interiorized and hence inaccessible to the researcher" (p. 17).
- 4 This lack of connection among members of the audience is partially eliminated in the home celebration of media events, as Dayan and Katz (1992) have shown.
- 5 For a study of some of these rare instances of "audience self-expression" in the age of mass media, see Newman's (2004) work on radio audiences.
- 6 This is what Dahlgren (1998) meant when he said that "'audiences' are always *at least in part* discursive constructs, shaped by specific institutional needs and discursive domains" (p. 307). In the same vein, see Bratich (2005).
- 7 See Webster and Phalen (1994) for a discussion of the different images of the audience implied in communication policy, and Hagen (1999) for a view on the impact of audience measurement on journalists and media producers.
- 8 For a detailed history of audience measurement in broadcasting, see Beville (1988) and Buzzard (1990).
- 9 Space limitation does not allow for a proper historical and conceptual contextualization of audience measurement within the field of technologies of control. See Beniger (1986), in particular Chapter 8, for that contextualization.
- 10 It would be questionable, at the least, simply to say that it is the evolution of technology that determines the relevance and form of audience measurement. There are obvious and complex institutional forces at play in these processes – and their analysis widely exceeds the reach of this essay. It is possible, however, and even fruitful, to look at the evolution of audience measurement from the point of view of the change in the communication technologies whose use constitutes the audiences being measured. See, along these lines, Napoli (2001, 2003, and 2011).
- 11 Print periodicals can be considered, in this context, a hybrid mode. On the one hand, there is a physical container that can be sold in exchange for payment. On the other hand, print periodicals have relied on advertising as a significant source of revenue for most of their history. The hybrid business model of the press obviously points to the insufficiency of the technological argument to explain the degree of reliance on advertising, and thus the importance of audience measurement – no doubt economic, legal, social, and historical factors need to be taken into account as well. Non-broadcast television also offers an interesting point of comparison, since control of access to communicative products does not rely on restricting spaces or on selling containers, but rather on technological barriers raised between producers and audiences – scramblers, etc. – in a fashion similar to the ways in which pay models have been implemented online.
- 12 Again, a narrative more nuanced than the one being offered here would be needed to explain how advertising became the predominant business model for broadcasting. See, for instance, Smulyan's (1994) history of the commercialization of radio in the United States.
- 13 See Bermejo (2009) for an evolution of online advertising revenues.
- 14 ARPANET was a wide-area computer network created in the late 1960s with the support of the Advanced Research Project Agency of the United States Department of Defense. It is commonly considered the precursor of the current Internet.
- 15 Obviously, asymmetry is not a necessary trait of the World Wide Web. In fact, the original design of the web by Tim Berners-Lee allowed users to modify web pages easily. However, as Berners-Lee (2000) has explained, the spread of the web in its inception was

accomplished at the expense of eliminating the original ability to edit the content displayed. The subsequent evolution of the web into what has been named Web 2.0 is in a sense a return – though incomplete and often highly controlled – to the original symmetry of the web’s design.

- 16 For a detailed analysis of these three elements and of the birth of online audience measurement, see Bermejo (2007).
- 17 In fact the “online audience measurement industry” could as well be called the “web audience measurement industry,” since, among all the different online communication tools, it was the web that attracted the most advertising interest and on which measurement efforts would concentrate.
- 18 In other media, even though different methods may be used to measure their audiences, there is usually a method of reference, and also, usually, a measurement operation of reference per medium per country. This has not been the case for online audience measurement.
- 19 Actually, the first metering device ever used to measure the media audience was a radio audimeter (Beville, 1988). However, the increasing proliferation, miniaturization, and portability of radio receivers made it impossible to use metering devices for most of radio’s history. In recent years, the advent of portable people meters has allowed for the reintroduction of audimeters as a way of measuring radio audiences.
- 20 Those that provide data for more than a few hundred websites use non-traditional sampling techniques in order to generate very large samples that need to be statistically manipulated to correct for bias.
- 21 Indirect inferences and complementary sources of data can aid in this endeavor. However, most records of online activity do not provide any direct demographic information that could be used to produce a precise profile of the audience being measured.
- 22 Tags are one of the tracking devices in use across the Internet. The first of these devices to appear were cookies, small textual files that are stored by websites in users’ browsers in order to identify repeated visits by the same user/browser. Tags, in their different denominations and forms – web beacons, clear Graphic Interchange Formats (GIFs), JavaScript tags, etc. – serve the same function of identifying subsequent requests by the same browser, but they allow greater flexibility in terms of the range of information collected and they facilitate the automatization of the analysis of this information. Flash-cookies also belong in this family of tracking devices currently used in online communication.
- 23 In this sense, the current state of online audience measurement and the new possibilities of obtaining information about the audience are also affecting the ways in which journalists see their role – see, for instance, McGregor (2007) – and the ways in which news organizations manage their business – see Graves and Kelly (2010).
- 24 It is obvious that the final goal of advertising is the generation of sales. In that sense, advertisers cannot be satisfied with simply knowing that their ads have been seen, heard, or read by an audience with a specific size and composition. However, in the world of the mass media, this is precisely what advertisers pay for. The online environment seems to have raised the accountability bar, and advertisers seem to be increasingly dissatisfied with advertising campaigns that only guarantee a certain audience. They increasingly demand proof that the audience is moving toward purchases, and this explains the interest in clicks and the growing relevance of performance-based pricing models. See Hoffman and Novak (2003) for an examination of the different pricing models used in online advertising.

- 25 This centrality of ratings has lead Meehan (1984) to provide a third answer to the question "What is the commodity produced by advertising supported communication media?" To the "naïve" answer – programs – and Smythe's (1977) answer – audiences – she added a third one: ratings. For her, the commodity that is traded in broadcasting's advertising market is not audiences – since they do not go through any real manufacturing and sale process – but rather the information produced about audiences through a complex set of institutional, economic, and methodological arrangements: the ratings.
- 26 On top of this, and because of the effectiveness of the system and of the ability to keep track of users' reactions to the ads in the form of clicks, search engines have been able to offer advertisers performance pricing models that seem to be more attractive to them, since they provide proof that users are closer to becoming consumers.
- 27 This led Dahlgren (1998) to contrast the past with the present of audience studies: "In some slightly mythic recent past – of no more than a few decades ago – 'audiences' used to be a rather unproblematic notion. They may have been seen at times as difficult (and expensive) to research, but the concept and the empirical reality it referred to had a fairly common-sense quality. [. . .] The status – ontological and epistemological – of 'audiences' was generally not in itself a topic which engaged researchers. Today we find ourselves in a very different situation" (p. 298).

Always at Crossroads

Studying Online/Offline Intersections as a Postcolonial Feminist Researcher

Radhika Gajjala

ABSTRACT

This chapter explores the transition from audience studies to cyberethnography on the basis of the author's own experience in doing research in computer-mediated communication and in teaching in online environments. The chapter describes her experience in developing methodologies for studying Internet interactions through theoretical perspectives by drawing on postcolonial feminist theories and critical cultural studies. Doing ethnography at online/offline intersections requires a hands-on approach, whereby the researcher works to build techno-mediated contexts while simultaneously living in them and also staying connected to related contexts offline. Such an immersive methodology allows the researcher to understand computer-mediated communication in global environments. In particular, the author refers to her experience of the "South Asian Women's network (SAWnet) refusal," as she developed her cyberethnographic methodologies in the early 1990s. She describes her experience in developing appropriate research methods to study such Internet-based global media.

In her article "The Challenge of Changing Audiences," Sonia Livingstone notes the shift in media communication from "mass" (one to many) to "communication among peers (both 'one to one' and 'many to many')." She asks if this means "that the concept of the audience is obsolete" (Livingstone, 2004, p. 75). Indeed, in turning to

study the Internet and computer-mediated communication, one might ask this question: Is the phrase “audience research” relevant anymore? For instance we hear terms such as “lurker,” “participant,” and “prosumer” (producer plus consumer), which seem to suggest a different relationship between the viewer and the media environment than the term “audience” would describe. When studying online-mediated environments we are forced to re-examine our relationship to the texts and screens we encounter.

What follows in this chapter draws on my experiences as I encountered this internet-mediated environment as a user, prosumer, teacher, builder, and researcher of online content through frameworks derived from postcolonial and feminist theories. As I narrate my encounters and dilemmas, my journey and explorations are situated, hence they are written from the vantage point of my particular location. The threads opened up here are intended to invite the reader to engage in an open-ended conversation with my thoughts and concerns.

My work occupies unique intersections of media and critical/cultural studies, as I continue to develop critical ethnographic methodologies – under the heading of “cyberethnography” and “epistemologies of doing” – for research and pedagogy at online/offline and global/local intersections and nodes. Communication and the understanding of organizations, as well as the role of culture and politics and of economic and everyday life are central to my research, as I conduct ongoing participant and performative ethnographies in emerging areas where digital communicative environments impact and shape globalization and where development work produces unexpected encounters between so-called new and old technologies.

Thus I examine how individuals act within communities while their subjectivities are shaped and they are produced as actors or subjects within interdependent global/local hierarchies. Not only do I ask who gets mapped out and why, but I also seek to understand *how* this happens, processually and structurally. I want to explore, for instance, how voices are produced, either in development contexts or in online contexts, and under what conditions “subaltern” speech gets heard. However, rather than stop at a euphoric celebration of this emergence of voice from a thus far marginalized group, I also try to investigate what implications these emerging voices might have for existing and emerging structures of power. I want to track how voice emerges in any of the contexts I examine, in order to understand where oppression shifts when particular marginalized groups gain representation within structures of globalization.

My continuing research examines social networking systems and craft movements online – specifically, the marketing of handspun and naturally dyed yarn within the context of what has come to be known as the “knitting renaissance.” I examine these online e-commerce frameworks for eco-friendly products and the consumer cultures evoked in these contexts in order to learn more about how the market is shifting and positioning consumer agency while it tries to educate consumers to adopt more eco-friendly ways of living and consuming. I suspect that these online movements (some under the header of “only hand-made”) mobilize existing digital technologies so as

to form networks and collaborations that have potential for producing shifts and collaborations just as cyberfeminists have hoped. Whether they fulfill their potential or are appropriated by power structures remains to be seen.

When I first attempted to do academic research on the Internet through the discipline of media studies, using critical communication and cultural studies frameworks, I realized that the disciplinary formulation of the notion of “audience” would not work for my research. I then delved into much of the literature that existed at the time and saw that several cultural studies scholars have negotiated the concept of “audience” even prior to the emergence of the Internet as a commonly accessible medium.

Thus I found several such scholars’ work to be of use in thinking about the relationship between viewers/readers/consumers and media texts. Stuart Hall’s important conceptualization of theory as struggle and of the notion of articulation (Hall, 1980) helped me justify the conceptualization of my research as a process – always partial, always incomplete – but with important findings to contribute to academic scholarship nonetheless. James Carey’s (1989) paradigm-shifting work on communication as ritual allowed in turn for a fresh approach to the study of media cultures and practices. Other scholarly research inspired me to rearticulate the idea of media research as an academic and political enterprise so I could proceed with my work: for example Larry Grossberg’s (2006) emphasis on radical contextualization, Herbert Schiller’s (1976) critiques of cultural imperialism; John Fiske’s (1987) writings on resistance and audience meaning-making; and Steve Jones’ (1995) early work on computer-mediated communication. These were some of the materials that assisted me in finding an anchor within the discipline.

However, my journey as a feminist researcher who was beginning to make connections with subaltern studies frameworks was a fairly lonely one within the discipline of communication, rhetoric, and media studies. Feminist scholars who engaged with issues in science, technology, and epistemology while questioning the universality of “knowledge” – scholars such as Donna Haraway, Katherine Hayles, Evelyn Fox Keller, Linda Alcoff, Gayathri Spivak, and many others – assisted me in framing my work as situated knowledge that emerged from a particular location. In addition, postcolonial feminist philosophers and anthropologists such as Uma Narayan, Kiran Narayan, Chandra Mohanty, Kamala Visweswaran, or Mary John (to name only a few) were also encountering the same problems and challenges that I was facing in my research, even though they did not carry out their work in media environments such as the Internet.

Further, just as I thought I was alone struggling through (inter)disciplinary shifts and crossroads, I found that there were also colleagues in graduate school and beginning faculty members who were developing methods and theoretical frames for the study of the Internet. For instance, members of the “Spoon Collective” (http://www.drifline.org/spoon_collective.html) played a significant part in my early Internet investigations, enabling spaces of practice, experimentation, and conceptualizations. In addition, as I was getting done with my dissertation, I discovered colleagues such

as Lisa Nakamura, David Silver, Gil Rodman, Anne Balsamo, Jillana Enteen, Jonathan Sterne, Annette Markham, Nancy Baym, Mia Consalvo, Terri Senft (Janedoe), Lori Kendall, Kate O’Riordan, Carolyn Bassett, and so many others¹ who are now part of a fairly large and growing group of scholars called “Internet Researchers” and/or “Cyberculture Scholars.”² These were colleagues I had gotten to know interpersonally via Usenet Bulletin Boards, email lists, Internet Relay Chat systems on Unix, and MOOs (Multi-User Domains Object Oriented). In instances when we finally did meet face to face, we would mostly remember each other on the basis of our email account names or pseudonyms (mine being “Cyberdiva” and “cyborgwati”).

In the present chapter my task is to map my explorations of methodology for the study of Internet-mediated contexts. The first section of the chapter narrates my first encounters with computers, audience research, and Western academic frameworks (both quantitative and qualitative). The next section describes my main methodological framework and how it emerged through my experiences as a researcher of a South Asian women’s email list. The subsequent section outlines how I developed this framework still further, in pedagogical settings where students were required to “do technology” as they researched Internet-mediated environments.

Studying Computer-Mediated Cultures: Point of Entry

In this section I reflect on my experience of studying computer-mediated cultures, and I map a path that starts with audience reception and moves to offline/online and global/local intersections and mediations.

In my early years of graduate school as a Master of Arts (MA) student, I was introduced to the phrase “audience research.” At that time I learned that audience research was mainly connected to numerical findings – of television and radio shows, of advertisements, and so on. A magical piece of software on the DOS machine, called “SPSS” (Service Provisioning System Software), would spit out various statistical analyses that I was reluctant to do “manually.” All I needed to do was to figure out the variables, the questions to ask, and the meanings of the data that the computer threw out at me. I loved it. Think up variables, punch them in various combinations, and watch the computer spit out the results. I did not have to worry about statistical process – manually – which, even though I am a statistician’s daughter, I was terrified of. Punching things into the computer to see what it produced was fascinating to me. This fascination with the computer followed in the wake of my absorption with the mechanical typewriter in preceding years. I found nothing more comforting than the rhythm of typewriter keyboarding exercises as my fingers typed out the routine “asdfg,” “qwert,” and so on. As the rhythm went click-clickety-click, my thoughts – my very “being” – began to be materialized on white paper.

In the mid-'80s, when small businesses that previously offered typewriter tutorials began to provide computer training, I was compelled to sign up. As a "housewife," freelance writer/amateur poet, and mother of a toddler who was equally fascinated with his mother's typewriting, I sought to improve myself by going to computer tutorials. I learned early programs such as Word, BASIC, COBOL, and a smattering of Fortran.

I had read books about artificial intelligence and ELIZA (<http://www.knowledgerush.com/kr/encyclopedia/ELIZA/>), and I wished the computer would write poetry for me as well. As I learned more about computers, the punch cards that I had often stumbled across in my brother's strewn belongings when he came home in India for vacation from his Indian Institute of Technology (IIT) campus began acquiring historical significance to me. Later these punch cards acquired even more meaning, as I realized their similarity to the cards on the Jacquard loom once I began examining offline and online technologies in global/local contexts. Little did I know that, in my search for magic³ and in my laziness, I was to stumble upon complex, nuanced intersections of science, technology, text, image, subjectivity, and gendered spaces of technocultures.

I did not know it then, but the business that offered these tutorials was training the future off-shore labor forces for transnational businesses. Globalization in digital formats had arrived in my backyard in Bhopal, India, in the mid-1980s. Thinking historically, it is no surprise that the infamous Bhopal Gas Tragedy (December 1984), which resulted from manufacturing industries off-shoring outmoded technologies to third-world urban spaces, signaled the transition to a different phase in globalization. Globalization would appear more sanitized and benevolent even as more manufacturing jobs and computer hardware factories continued to be off-shored onto borderlands (*maquiladoras*) and other third-world regions, while the clamor of the digital made this process invisible. Thus, as audiences the world over watched the broadcast of this disaster and activist groups protested against the transfer of outmoded technologies, the focus of interest for communication scholars conveniently shifted to examining empowerment through information technology (IT).⁴

Upon completion of my MA, I worked my way into a Doctor of Philosophy (PhD) program, which had quite a different focus – namely on how communication should be studied. I entered the world of rhetoric and media studies and was introduced to cultural studies paradigms. No punching was possible here. Instead, I did encounter works by Edward Said, Jonathan Fiske, Kenneth Burke, Meagan Morris, Ien Ang, Homi Bhabha, Gayatri Spivak, and Michel De Certeau among others. My idea of the media and online audiences and my approach to research took on different meanings in this context.

Cyberethnography

Starting with my dissertation project, which began in 1994, my work has continued to question whether feminist spaces for multiple forms of embodied power and for

networked and connected thinking/acting (as described in studies such as those of Donna Haraway) are possible online. In probing the intersections between feminisms and the new technology, I have attempted to explore and comprehend those aspects of production and design – skills, technical and cultural literacies, and material access – that are necessary to make such connections and collaborations possible.

Scholars such as Steve Jones point out that “issues with which sociologists and anthropologists, among others, have traditionally engaged when conducting their research are part of [‘Net’] discourse, for it becomes necessary to cover the ethical ground concerning participant observation, privacy, biography” (Jones, 1995, p. 3). These issues require us to move beyond frames of representation, viewership, and reception; they compel us to engage the context as producers, designers, users, authors, and inhabitants – in addition to being audiences, consumers, and readers. Thus “cyberethnography” unfolded as a methodological approach for the study of online contexts during my attempts to study a women-only email discussion list called “SAWnet” (South Asian Women’s network).

My research on SAWnet began after I had been a reader and participant in that email list for a while. This was an online space that I had originally entered in an attempt to find a community of women who might share a background similar to mine: educated South Asian women who had traveled away from their home-country or had a “cosmopolitan” background. Prior to my decision to write about SAWnet, I was already a fairly involved member (since late January 1994). I shared some fiction and poetry with members of the SAWnet email listproc. My attempts at studying this group took several forms.

My decision to research that email list was made when I had been a member of the listproc for a year or so. By then I was definitely a participant researcher. In summer 1994 I started my research by posting a survey on SAWnet with the intention of finding out how the nature of the online community had changed since the time of its formation. I also mentioned my intention (which was based on my being a freelance writer for magazines and newspapers in India in the past) of writing at least a magazine article about SAWnet. My interest in the changing nature of the group led me to try to find out if any members felt dissatisfied with how the group was interacting. I wanted to see what kinds of discourses were being marginalized. This prompted me to investigate the possibilities of dialogic interaction within an online community like SAWnet.

In researching the list, I had no access to the offline participants themselves. I was going to read their postings and textually analyze them. I also sent out a survey on the list, and I asked members to answer the survey. In other words, I was not sure how to go about researching that group of people and their use of the medium – the email list named “SAWnet.” Relying upon a combination of textual analysis of specific clusters of conversation and some (very few) replies to the survey I sent out, I wrote a paper for a graduate seminar, linking my analyses to theoretical frameworks from postcolonial theory, mainly on issues of nation and on the role women played in postcolonial nationalisms. I might have proceeded to write in this manner, mono-

logically, describing what I read as “texts” on the list. I would then have had a dissertation that “proved” how the literature on nationalism and women could be extended to describe South Asian communities in diaspora in the United States. Had I done that, my work would have appeared to be a critical engagement with the issues. In actuality, the work would have been quite uncritical, despite the fact that the language and the literature I was drawing from were cultural studies, postcolonial theory, and third-world feminist theory.

All this was going on while I was aware of the rule that posts could only be shared with nonmembers of SAWnet if the poster gave permission to this effect. I had asked and received permission to use the posts I had used in my paper. I did not imagine that writing a description of SAWnet would be a problem for any of its members, since this does not involve the use of anyone’s messages on SAWnet. However, in spring 1995, an anthropologist from New Zealand (not a South Asian) was also studying the same list at around the same time. She announced her intention of writing a paper about the community by posting her intentions to the list. It appeared that she was trying to sort out what methods and codes of ethics were appropriate in this environment. As an anthropologist, she treated the list as a group of people – not as scrolling screens of text, as I was inclined to do while writing up my research. She contacted some members of SAWnet personally, to ask for permission to use our posts. She announced her decision to study SAWnet and to write a paper about SAWnet (as I had done earlier on in 1994). This launched a series of discussions about the value of studying a group like SAWnet. Some women protested. They wanted to be “left alone” in what they perceived to be a private space. Discussions began to get very interesting, even heated. I decided to remind members of SAWnet that I, too, had been writing about SAWnet as part of my dissertation project since 1994. My entry into the discussions regarding SAWnet contributed to and further complicated matters (Gajjala, 2004).

As it turns out, my response to the posts and my interactions with members, both on and off the list (through a now antiquated chat feature in a DOS computer known as “talk”) took me in a direction where the participants became human subjects, even though I was researching them as “texts.” The “texts” were alive – they talked back to me. This realization became clear and evident to me once the group of members on the list began questioning the anthropologist about her research motives. The texts were talking back indeed.

It was then that I knew that I needed to be an ethnographer. I was too much a part of the life and community of this online group to be a detached survey researcher trying to understand users’ reception of meanings or the audiences’ meaning-making. I was, in very real ways, too much a part of the virtual community to be content with just analyzing what was happening on the list as “texts.” Thus, while textual analysis, just by itself, would have been fine to describe the content of the list during a specific period of time and to reveal how a very specific group of women with interests and links to South Asia were conversing at a very specific time and location, that would not have provided a glimpse into the process, form, or limitations of the

medium. Nor would textual analyses give the researcher insights into the hierarchies that are produced through the human–computer interface and through the ways in which different social groups used this specific medium. A textual analysis, in other words, could only be a part of more immersive kinds of investigation, which would help me discover how voice and silence get played out in such an online space.

Online experiences and interactions are, simultaneously, discursive subjects and living texts, where each text may follow its own logical force but all of them are also speedily frozen into archives, as “the past” of texts living in the present. The participants producing these texts develop affective relations within such a space and develop contextual bonds in this social world – bonds that hold them accountable to each other through the logical force of the rules listed and of the content shared. This in turn produces what is often termed a “virtual community.” To get at the multiple mediations that produced voice and silence in online contexts, a combination of multiple methods under the umbrella methodology of critical feminist ethnography was needed.

The Postcolonial Feminist Cyberethnographer

Further, in that particular instant of studying SAWnet, in order to find help with the dilemma I faced regarding my subjects, I turned to the work of postcolonial feminists and feminist cultural anthropologists. The work of Kamala Visweswaran, Kirin Narayan, Ruth Behar, Deborah Gordon, Uma Narayan, Mary John, and others was very useful to me as I was articulating the issues at hand. I had already been drawing on work by Haraway, Spivak, Alcoff, Harding, and others, in addition to work by subaltern studies researchers. This body of work helped me examine and theorize on the basis of the dilemmas and contradictions I faced in the “field” of cyberspace as I was studying SAWnet and issues of method and ethics of research. Those theories allowed me to open new ways of understanding what I would later learn were the beginnings of South Asian digital diasporas (see Gajjala and Gajjala, 2008).

The “SAWnet refusal” raises complex issues in relation to feminist ethnography and feminist Internet research. While the study itself was interrupted (this is what I refer to as a “refusal”) and my attempt at studying the group failed, the discussions leading to the failure highlighted several important issues in relation to ethnographic practices online and in relation to feminist practices of representation relevant to media and audience ethnographies. How do ethnographic practices and the ethnographer evolve in an online context? How are they revolutionized? What constitutes the field and how do we define its boundaries? Further, can we transpose concerns that arise out of real-life (RL) anthropology or face-to-face ethnography onto the study of virtual communities without considering seriously the very important differences in the nature of face-to-face interaction and virtual interaction? When can RL anthropological and critical issues be considered relevant to online ethnography? (See Jacobson, 1999 for a discussion of some of these issues.)

Considering the interactive nature of online participation, questions arise as to who is an ethnographer, who qualifies to be a “native” informant, and what the options are for refusing to be a subject. Specifically, the experience highlighted for me some of the ways in which conducting ethnography in cyberspace is distinctly different from real-life ethnography, while it also underscored some issues/problems that are specific to the technology/medium (Gajjala, 2004).

My quest to refine the study of online texts and online audiences led me to become an ethnographer and an amateur producer of online content. I examined how subject positions emerged in continuous interpersonal and group interactions and were simultaneously broadcast into public space, while creating the feeling (illusion) of privacy – sometimes even of intimacy – for the person offline in front of a single screen. The only way to study such an environment was to consider a shift in methods that would be synchronous with the contexts I entered. This was the understanding I took with me into the classes I taught. In these classes, along with various undergraduate and graduate students, I developed further insights into being a researcher of online contexts.

Ethnographies at Online/Offline Intersections

Traditionally, anthropologists and archeologists travel thousands of miles to faraway places in the world and live there for extended periods of time, in order to represent the people and culture there. Their legacy has left us with one of the most important qualitative research methods: ethnography. It is also important not to forget the colonial history of the imperial projects of nineteenth-century anthropology. Those of us who are feminists and critical researchers using ethnographic methods continually encounter points of complicity with those epistemologies.

Attempting to grasp the complexities inherent in issues of access, design, and production of Internet-based communities and other such communication spaces led me to concerns well beyond the scope of online texts and their visual cultures. I was compelled to go offline to look at what people do at the computer interface offline. I discovered (and this should actually be no surprise) that people do not sit at the computer interface and use the Internet unless there is an offline community that links them to the global interconnections possible through the Internet. I learned that I needed to study how the Internet served offline communities and why it was becoming a necessary tool of marketing and globalization. At a time when a website or some form of Internet connectivity was increasingly offered as an “easy” solution to reaching the market or to connecting to the global, I felt that I had to examine and check if indeed the Internet was a panacea to all problems of access and circulation.

In 1998–1999 I had the opportunity to converse and communicate in writing with Annapurna Mamidipudi of Dastkar Andhra. The editor of the journal “Gender and Development,” Caroline Sweetman, had contacted me and asked me to write about

the Internet and third-world women. Having lived in the US for nine years by then, and not having actually done any extensive field research in any non-US or non-Internet context until then, I decided to invite Annapurna (whom I have known all her life) to write to me. During the writing of this article (see Gajjala & Mamidipudi, 1999), I realized that I was likely to make fallacious assumptions in my research on cyberspace contexts if I did not learn about the offline environments in which Internet technologies are being sold as solutions to all sorts of problems. I also realized that policymakers, activists, and academics (wherever their political-economic background and the ideology stemming from it) were prone to privilege “the Internet” as an entry point and to give less importance to years and years of work already done by field workers in offline communities. Just as the blinding emphasis on “new” media sometimes ignores the bodies of work on various media produced over time that historically contextualize and inform how these “new” media function in society, the popular discourse of the Internet as a savior of all unheard peoples of the world continues to blind researchers of Internet-mediated contexts, preventing them from looking at the complex, layered contexts that produce the artifacts we study “on” the Internet. Thus, an exploration of the Internet as a media form using ethnographic immersion as a methodology may yield shifting notions of the audience. The researcher must enter into the cyberspaces s/he is researching – yet be aware of the offline contexts, the layered literacies, and the nuanced negotiations required in order to navigate these online spaces and be audiences, users, or participants in such contexts.

Therefore my work now includes investigating contexts and communities formed around offline technologies such as the handloom – which has a very effective, collaborative community, formed around its use for the production of cloth in rural South India, weaving still being the second largest rural livelihood in India despite problems related to global markets and the oppression of modernizing discourses. Therefore the study of such “emerging technocultures” is about incipient forms of handloom technology (since weavers and marketers of handloom negotiate how transnational capital flows to and away from them) as much as it is about the study of newly developing forms of digital communicative environments and financial instruments.

Among other things, I ask the following question: What encounters occur between people from contradictory worlds, and under what conditions would these encounters lead to dialogue as well as to further understanding and action toward a common emancipatory goal? My investigation led me to question the kind of subject implicit in cyberfeminist discourses, as well as to examine the kind of subject that emerges online. In my offline journeys through rural South India, ethnography is my main mode of investigation. However, while entering the field, I also work for the nongovernmental organization (NGO) Dastkar Andhra, which acts on behalf of handloom weavers in a variety of ways. Parallel to this, my offline ethnographies include travelling to various craft guilds and craft and fiber shows and expos and investigating the amateur practices of weaving, spinning, quilting, knitting, crocheting, and dying the yarn. Therefore my ethnographic method intersects with action research. Whether I travel as a collaborator with the NGO workers and officers, as

a participant in craft guilds, as a shopper, or as an ethnographer, I am continually marked. In India I am marked as a non-resident Indian tourist, consumer, and collector of handloom fabric and crafted artifacts to be transported back to the US in order to be used/displayed in my home or given as gifts to friends living here. In the US, among predominantly rural northwest Ohio communities, I am marked in certain ways as an outsider (even though I am a citizen of the United States), and I am sometimes included as an insider in select groups when I participate in rituals and behaviors that these communities find familiar.

I must note that, in itself, the social marking of my outsider or insider status neither places me in a lower position in a hierarchy nor frames me as more or less powerful than those I work with. What frames me as possibly more powerful than them is my academic position and the possibility that I may misinterpret and distort events on site. Therefore the scholar's enactment of "with" in "working with" a community outside the academy must be considered a very tenuous and delicate process of collaboration. This marking of my outsider status serves as a continuous reminder to me as an ethnographer that humility and uncertainty are an integral part of the learning process. Assumptions of intrinsic scholarly authority on the part of the researcher get her nowhere in her attempt to understand the contexts and motivations in any situation she investigates. The researcher's authority and power is not in the field *per se*; rather it resides in how she represents the field and in how her work mobilizes the field toward specific power formations.

Latour (1996) notes the power dynamics implicit in the process of translation from other contexts to academic writing and describes how this happens through the formation of "immutable mobiles." He writes:

[K]nowing is not a disinterested cognitive activity; harder facts about the other cultures have been produced in our societies, in exactly the same way as other facts about ballistics, taxonomy or surgery. One place gathers in all the others and presents them synoptically to the dissenter so as to modify the outcome of an agonistic encounter. To make a large number of competitors and compatriots depart from their usual ways, many ethnographers both had to go further and longer out of *their* usual ways, and then come *back*. The constraints imposed by convincing people, going out and coming back, are such that this can be achieved only if everything about the savage life is transformed into immutable mobiles that are easily readable and presentable. (Latour, 1996, p. 15)

Therefore I am not suggesting or claiming that expressions of humility, participation, contribution, or what I term "epistemologies and pedagogies of doing" (Gajjala, Rybas, & Zhang, 2010) are ways of extricating the researcher from such potential complicity and appropriation. Rather I am attempting to disrupt and upturn previously established binaries – "immutable mobiles" – through the snapshots I produce, understanding fully that the latter may be interpreted as "native" information on faraway premodern lives, regardless of all the disclaimers I make. The difficulty is not in gaining understanding through learning, travelling, and doing; the difficulty, the struggle, and the dilemma are in the craft of writing. If, as a researcher and as an academic, I am to establish that

I can write appropriately for an academic audience, then I must risk the flattening of what I have learned. If I am to break with the tradition of academic writing, I must risk doing it not effectively, sounding uninformed, or losing my own voice and location as a “scholar.” Within these stated constraints, my methodology is a struggle that includes the process of crafting the academic text.

Online, in cyberspace, the ethnographer does not always have to travel in the kind of physical space where the whole body encounters the field face to face. But the travel in time and in cyberspace allows her/him to live in the field in a different way and to carry out concrete participant observation. In order to conduct her research effectively, the ethnographer must first code herself into existing in these online worlds.

For instance, in *Material Virtualities*, Jenny Sunden (2003) writes of the typing into existence that is a requirement for any sustained online identity. This act of *be-coming* online creates a close relationship between the typist and the character she/he types into existence in the online world. This sort of relationship is no doubt the basis for the process of transformation described in the three-dimensional film “Avatar” released in 2009. It is of course no coincidence, I am sure, that the character, Mary, played by Sigourney Weaver, who heads the team that is providing intelligence (implicitly and explicitly) to the military and to the corporation, is clearly modeled on popular images of the female anthropologist (in short, she seems very Margaret Mead-like).

The online avatar/identity is curiously the production of both the offline and online world. Gonzalez (2000) critiques the naïve assumption that there is the virtual/real binary separating the reality from the virtuality. Actually, the closer one observes and participates in an online community, the more s/he would agree that the interplay of real and virtual is always present. No one can transcend the social categories and the repertoire of experiences, skills, and literacies that define who s/he is in the offline world, even as s/he connects to online worlds. Likewise, the learning and understanding produced through online living definitely exerts influence on the perception of the offline world.

Methodological approaches informed by “epistemologies of doing,” in conjunction with visual and textual readings and ethnographic investigations, lead to an actual examination of subjects in process. The production of layered, situated subjectivities in techno-mediated environments – online and offline – allows an understanding of situated agency within spectra of choices and constraints. Examining where we place our bodies or where our bodies are placed (whether visually, textually, or through architectural and city design and mapping) in time and space – in relation to technologies old and new – and how we interact with these environments leads to an understanding of the complexity of unequal power relations and structural formations within a global cyberspace.

Epistemologies and Pedagogies of Doing

To further understand the nuanced and layered ways of being online, I introduced assignments in my classrooms where students would be required to be immersed in

explorations and in the production of environments and selves in online environments such as text-based MOOs (multi-user domains/dungeons, object oriented), Web 2.0 tools such as YouTube, wikis, and blogs, social networking sites such as MySpace and Facebook, and three-dimensional environments such as Second Life and World of Warcraft.

In class settings I engage the continuum of possibilities along key dialectics of space/place, virtual/real, embodied/disembodied, membered/dismembered, and voice/voicelessness, in order to talk about technocultural identity. These identities are produced at various online/offline and global/local intersections through the following: visual performances and discursive self-representations; simultaneously disembodied and multiply-embodied performativity; and layered sociocultural, linguistic, and technical literacies. Students from my various classes engage as amateur ethnographers in such virtual worlds and online social networks. As an anthropologist, Boellstorff has shown, in his *Coming of Age in Second Life* (Boellstorff, 2008), that immersion in the context allows an understanding and a familiarity that in turn reveal multiple modes of meaning-making in these contexts. To borrow a phrase from a student in one of my classes where we used Facebook as a site to examine digitally media identities, online social networks and virtual worlds are “places” where “we put our stuff out” to share it with friends.

Further, over the years, online global networking and gaming practices have shifted our understanding of “friends” and the relational ways in which we exist among our communities and networks of peers. We no longer use the term “friend” to refer only to the one or two people whom we interact with in face-to-face encounters, or to people with whom we share our deepest confidences. There is also an interesting convergence between friends and audience, in an almost theatrical sense. It is at the intersection of placing objects in Internet space and in performing for networks of friends that current manifestations of online voice and agency emerge relationally.

This notion of placing objects, or “putting stuff out there,” as the student referred to above called it, and the perception of online space as a place are not limited to social networking sites such as Friendster, Facebook, orkut, hi5, MySpace, and so on. Neither is this notion of *placing* the self, relationally and performatively, for an imagined and real audience of friends new only to the post-online social networks. The idea of investing identity in objectified symbols, where the symbols take on a meaning of their own within the internal logic of the online world, has existed from the time of purely text-based MOOs and MUDs (multi-user domains). This notion of owning, placing, and sharing exists in music sharing software, computer games, and other virtual worlds as well. In fact the placing of the self relationally leads directly to the production of contextual and relational avatars (online identities) that are constructed and narrated technically, textually, and relationally through the encounters of individuals with online social contexts, and these encounters in cyberspaces produce different kinds of sensory experiences. The individual’s response to the new media environment is nuanced and layered as s/he learns to live and work in yet another global social world, and these experiences of immersion challenge older, established notions of “audience” and “user.”

Thus subjects (not audiences or users) are *placed* historically, contextually, and relationally in online networks. This placing leads to a reconfiguration of identity, labor, and literacies in tandem with transnational capital flows. This production of virtual identities simultaneously generates and dismantles shifting labor relations within the global economy, as labor forces are retooled and reskilled to work in digital economies, while specific offline production processes and labor conditions are made invisible.

As a student in my class pointed out after her experience in Linguamoo (an academic MOO-based community in the early 1990s and early 2000s): “[T]he meaning of language isn’t what we expect it to be necessarily when we put it out into the world in a particular rhetorical situation” (MA, 1997). This was one of the first times when, before asking the students to enter the MOO, I had also programmed and placed objects strategically in the environment, for these students to engage with. Each of the objects I had built was meant to engage specific concepts, on the basis of the course content. This student’s reaction leads us to understand what the blogger at cultureby.com is signaling when he says:

[W]hen the Second Life inhabitant present[s] herself as an elf, a chipmunk or a flaming goddess, she is using cultural categories and understandings from “away.” It is easy enough to say, “oh, but we all know what an elf, a chipmunk or a goddess is,” but this is precisely where the [. . .] [researcher] [. . .] is supposed to be scrupulous (as we may expect a philosopher to be scrupulous about claims to knowledge or judgment). (Grant McCracken, 2008)

Therefore, whether this happened in Second Life in 2007 or in LinguaMOO in 1997, the objects and contexts within these virtual worlds started functioning with a logical force that placed them firmly in the virtual world context. This virtual world context is related to the offline context, of course; it seems to mimic offline worlds, and indeed it has an impact on the body and mind that get affectively incorporated into the interface. However, just as physical objects carried out of their habitual context into a different one acquire a meaning specific to the new context, virtual objects, words, and labels do the same. This travelling of the objects and symbols shifts the meanings and requires different contextual literacies and skills for their re-placement and re-negotiation.

A new interface, a lot of times, poses challenge for users who are not familiar with it. The new environment, the new technoliteracy required, and the need to interact with people even if only virtually, all contribute to the uneasiness many users feel when they are first introduced to MOO, Facebook, or Second Life. From registration to the creation of avatars, Second Life guides the users through the journey of acquiring a digital being that participates in meaning-making in the virtual world and definitely has material consequences and material anchors.

So where is the “audience” today? When the viewer is no longer “outside,” viewing from a distance, but is involved in the production and circulation of the text, movie, or game, we must shift the relational viewpoint that allows us to understand how the media pervade our lives.

Conclusion

As we have seen in this chapter, my approach to the study of online media contexts draws from multiple disciplines out of necessity. I adopt critical ethnographic methodologies, whether under the heading of “cyberethnography” or “epistemologies of doing,” for research and pedagogy at these online/offline and global/local intersections and nodes. These ethnographies, interspersed as they are with my personal experience of being in communicative spaces of the diaspora through my own life, inform my continuing research in these areas.

My encounter with SAWnet in my initial forays into research on Internet-mediated communication has strongly shaped the way I continue my own research and advise my graduate students on the issue of methods for online research. In addition, my offline ethnographies, travelling with non-profit workers in urban and rural India, have shaped my perception and understanding of the impact that academic and corporate research about the Internet can have on shaping policy that affects the everyday life and the livelihood of people who have no say in how they are made to participate in or denied access to technological and financial structures of power.

Paradigms that Internet researchers engage with have allowed us to complicate the definitions of “audience” and audience research. But this is not the only point I wish the beginning researcher to walk away with. Identities produced within digital contexts enabled by computer software and hardware are made possible through the cooperation of the sociocultural digital place and of global networks involving time-space compression. These sociocultural contexts are co-produced by inhabitants who access these contexts. Both offline and online contexts that co-produce online environments – through presences and absences – are situated in uneven hierarchies of race, gender, class, caste, geography, language, technical literacy, and so on. At any moment in time, the individual researcher’s goal to understand these multiple layers can only be partial. The researcher needs multiple methods – sometimes textual analysis, sometimes a “deep hanging out” (Madison, 2005), sometimes a quantitative analysis or in-depth interviews. The researcher must continually be self-reflective concerning her/his own role – but not to the extent of becoming paralyzed and silent. The issues that come out of this struggle are often as important as the partial descriptions and so-called objective analyses of interpretative and quantitative data. The researcher must name herself.

ACKNOWLEDGMENTS

I wish to thank Yeon Ju Oh, my research assistant, for her excellent feedback and encouragement on several drafts of this chapter and for her help with proofreading and editing. I also want to thank my newest mentee, Aditi Paul, for her encouragement and positive feedback as I was revising.

NOTES

- 1 I wish to ask my colleagues of that time (and those of now) to forgive any omissions: I have probably not mentioned some of my dearest friends and some of my most important colleagues.
- 2 See <http://www.aoir.org> and <http://www.amst.umd.edu/cwg/>
- 3 Television shows from the 1960s and 1970s such as *I Dream of Jeannie* and *Bewitched* had set me up to desire such magic in my life, so that I could indeed aspire to be a “super-woman” and to perform double shifts with great ease – a snap of the fingers and a blink, and I could be the perfect home-maker, mother, and creative writer.
- 4 Once the outsource/offshore IT workers were studied to reveal how “empowered” they were through IT, the researchers’ gaze shifted to examining online spaces of work and play. Thus the brown and black bodies laboring for the global IT industry were celebrated as empowered and conveniently packed away. At the same time the discourse of fan labor, consumer labor, play as labor, and so on emerged. This global “labor” force of users, consumers, fans, and computer-gamers has now become the focus of researchers, much like the celebration of “resistant” audiences of television in previous audience studies scholarship. Let me hasten to say, however, that this research is not without value when it is done with a great deal of reflection on the hierarchies produced and the kinds of labor it privileges. Neither are the two – the labor of brown and black bodies and the labor of fans and gamers – mutually exclusive: in my continuing work on transnational labor, digital labor, affective labor, and globalization I examine some of these intersections.

Studying Online News Audiences

Trends, Issues, and Challenges

Deborah S. Chung

ABSTRACT

The exponential growth of thousands of online newspapers and millions of online news consumers is evidence that online news publications are a critical source of information. Online news sites have evolved over the past several years in content and form, and many have developed into serious publications incorporating innovative storytelling techniques and providing various methods of audience engagement. While research examining the evolving form of news online exists, very little is known about the audiences who visit the sites of these publications. How are online news audiences using interactive tools? How has the relationship between traditional information senders and receivers changed? This chapter surveys the major trends taking place in the world of online news publications and the latter's efforts to engage their audiences, as news organizations struggle to re-evaluate their traditional roles and practices in the online climate. This chapter's discussion includes, as part of news production, the integration of interactive features, the emergence of blogs, citizen journalism, and other social tools such as Twitter and Delicious.

Introduction

Throughout the history of news, technology has played a critical role both in advancing the spread and status of journalism and in challenging the traditional boundaries and conventions of journalism's practices and products. The Internet's multimodal and multidirectional qualities are altering how journalists gather and deliver information and how audiences receive and understand news. Newspapers, for example, which have been experiencing a continual decline in readership and circulation, have migrated online, in the hope of regaining audiences through the interactive lure of the medium. The Internet enables the convergence of different media forms and offers numerous options for audiences to find and consume news. As readers and viewers increasingly seek out the Internet as a major resource – for information, entertainment, and news – the Internet has attained the status of an upstart mass medium that is beginning to pose a serious threat to the established old media. Facing declining revenues and a shrinking readership for print media, the news industry has turned its attention toward audiences online and toward the ways in which traditional notions of news and news workers and enduring business models of journalism are undergoing transformation.

Scholars have devoted substantial attention to the growth of online news in the last decade. Research on online news has attempted to advance our understanding of the differing impact that qualities of the Internet such as convergence, synchronicity, and interactivity have on audiences' news consumption experiences (Chan-Olmsted & Park, 2000; Chung, 2004; Greer & Mensing, 2006; Rosenberry, 2005; Salwen, 2005; Schultz, 1999; Thurman, 2008). Newer communication channels have enabled audiences to have more engaged and involved experiences in seeking out information, and also increased levels of participation in defining and producing the news. Studying these changes in audiences' modes of engagement with news can help us better understand the vital role that informed citizens play in supporting and sustaining democratic structures of governance. Online news publications potentially offer more egalitarian opportunities for audiences to participate in civic life and to encourage them to become more actively engaged citizens. Functioning as a gatekeeper of information, the news industry has traditionally enabled citizens to make more educated decisions; it has also been a venue where hosts of competing individuals and institutions voice their perspectives in the public sphere. Many believe that the Internet and online news have the potential to extend these interactive opportunities for communication between and among various social groups and thus to offer a solution to the current crisis of journalism in the United States – a situation in which it appears that the media have lost touch with their audiences.

Several technological factors have contributed to the changing character of news audiences, particularly those who seek out the news online. The penetration of broadband (Pew Internet & American Life Project, 2009) has dramatically altered the way people read and view news and what they choose to do with the information

they acquire. News audiences are going online for more extensive news content from varied outlets and for entertainment and novel communication capabilities. Audiences' information-seeking behaviors are also changing because of saturation in media exposure and because of the exponential growth in options for media and communication tools. Consumers are also employing a high degree of multimedia switching and multitasking when they engage with new media technologies. Additionally, with Web 2.0 tools and social media taking center stage, the culture of active user participation and involvement has come to dominate some sectors of the media industry. In this rapidly changing media climate, we are witnessing a major departure from the traditional one-way dynamics of communication between senders and receivers of information to an interactive communication environment. As distinctions between senders and receivers blur in the online media environment, it is important to direct more attention to the processes that are creating shifts in journalism and in communication models of audience reception.

This chapter has five sections. The first takes a historical approach, in order to review and summarize the critiques directed at traditional approaches to audiences in mass communication. This section also considers the implicit promise of new media tools to alter and improve communication processes. The next section tracks the implementation of interactivity, a key quality of new media, in online news publications. The third section discusses how Internet news publications and blogs have affected news audiences – their consumption and reception of news – and explores the developing role of the Internet within the current interactive multimedia news climate. Noting the capacity of the Internet to enable audiences to become more independent agents of communication, the fourth section reviews scholarship on online news and participatory forms of citizenship, including on the impact of micro-blogging and social bookmarking tools. The concluding section examines future opportunities in the arena of online journalism and points toward the implications of an expanding active online news audience for research on the changing face of journalism.

Criticism of the Traditional Communication Model

The media have functioned as the gatekeepers of information in traditional mass communication models that depict a top-down, unidirectional approach to information dissemination. There has been a sacred distinction between mass and interpersonal communication channels, because senders of information in mass communication models have traditionally been separated from receivers of information. Shannon and Weaver's model (1949), which offered a linear and sequential process for the flow of information and communication, has reigned as the dominant mass communication paradigm for decades. Rogers (1986) refers to this model as "the single most important turning point in the history of communication science" (pp. 86–87).

Yet there has also been a long tradition of dissatisfaction with the traditional press regarding its insular and elitist information distribution practices. Media critics have argued that traditional mass media largely produce messages independently from the needs and desires of their audiences and that they have not provided opportunities for dialogue or political discussion with citizens. Habermas (1989) points out that the hierarchical structure of modern mass communication promotes a communicative model in which audiences are not invited to talk back. Christians, Ferre, and Fackler (1993) claim that the press has served primarily as a vehicle of expert transmission rather than as a network of community discussion. Rosen (1999) also called attention to the disconnect between journalists/news organizations and citizens/communities.

In response to such criticisms, newspapers have launched various movements such as the civic journalism movement, which aimed to re-engage with US citizens and their communities (Charity, 1995; Merritt, 1998; Rosen, 1992). For example, advocates of the public – or civic – journalism movement urged journalists to cover issues that are compelling to their audiences and communities and to frame stories that address people as citizens. Further responding to such criticisms, journalists attempted to provide, through polls and townhall meetings, feedback opportunities for citizen and community discussions, which then shaped journalists' reporting agendas (Nip, 2006).

In addition, promises about the unique qualities of the Internet, such as interactivity, have helped facilitate further opportunities for newsrooms to provide interactive experiences with news audiences, inviting them to participate in the production and presentation of news. The use of interactive features in online news publications allows audiences to experience an increased sense of agency (e.g., increased choice, personalization, customization, and interpersonal communication opportunities). These publications allow for various types of communication formats: one-to-one communications, for example email; one-to-few/many and few-to-few communications, for example chats; and even many-to-many communications, such as electronic bulletin boards (Morris & Ogan, 1996). The Internet allows news audiences to be active, prompting them to make choices with the help of an increased array of selection options in which the roles of senders and receivers are often merged. These transformations have significant implications for the existing mass communication theories, because traditional models no longer neatly fit a scenario in which audiences are increasingly refusing to stay passive. The Internet platform of online news publications allows for communication that may sometimes follow traditional models, but at other times may also give rise to altogether new configurations of communication.

Many professionals in the news industry and several media scholars have optimistically envisioned the new media as liberatory tools that can potentially undermine traditional forms of journalistic authority in the mainstream press and challenge the hegemonic power of traditional news content (Schultz, 1999; Schudson, 2005). The interactive and democratic capabilities of the Internet and its online news publications can, then – in principle – afford news audiences increased opportunities for participation and mutual discussion.

Online Newspapers and Interactivity

The exponential growth of online news publications and their steady consumption over the last 15 years have transformed the way news is delivered, presented, and received. Today, many century-old prominent news organizations have folded and many others have cut their print editions to a couple of days a week. Still others have opted to go exclusively online, ceasing print publication altogether. Web-based publishing continues to flourish, as many news organizations use the Internet as their primary platform. The following section documents how news publications make use of interactivity, a key quality of new media, in presenting daily news online as they seek to maintain their circulation – and presence – in the rapidly changing media environment.

Research documents the steady growth and development of online news publications. Interactivity, a buzz word dominating the news industry starting in the late 1990s, captured the potential and the promise of what could be accomplished with news websites. Outing (1998) argued that online news publications must embrace the task of facilitating communication between individuals and communities of readers, and that online news publications must strive to excel at such interactivity, in order to bring people together. New communication tools may offer audiences a newfound role as participants or as information providers, thus contributing to audience agency and to meaningful and relevant public storytelling. Sundar defines audience agency as

the degree to which the self feels that he/she is a relevant actor in the CMC [computer-mediated communication] situation [. . .] it is the extent of manipulability afforded by the interface to assert one's influence over the nature and course of the interaction. (Sundar, 2008, p. 61)

Agency allows users to feel involved as active participants engaged in the communication process. For example, hyperlinks allow users to choose specific news topics from an assortment of stories and to jump to content related to their personal interests. Tailoring news headlines offers a greater degree of control to the user. However, when examined more critically, the extent of the manipulability afforded to news audiences and the assertion of audiences' influence over content through such activities can appear to be limited. The audience may gain greater degrees of agency through other activities, which require more effort on the part of the user, such as using customization features (e.g., content submissions) or interpersonal communication options (e.g., message boards, chat features).

Several scholars found initially, however, that many news organizations had not pursued the full implementation of interactivity. These scholars criticized the media for failing to fully exploit the various interactive options available through the Internet. Initially, interactivity was implemented in limited ways, merely allowing

audiences a wider range of choice and selection options through multiple hyperlinks or audio and video files. In addition, the information was mostly dominated by text. Very few news organizations went the extra step to install more sophisticated interactive online features – byline links within stories, chat options, and discussion forums – that genuinely facilitated active human-to-human discussion. These observations about limited interactivity are documented in various studies going from the end of the millennium into the first decade of the new one (Chan-Olmsted & Park, 2000; Kenney, Gorelik, & Mwangi, 2000; Massey & Levy, 1999; Rosenberry, 2005; Schultz, 1999; Ye & Li, 2006).

Such findings may reflect the failure of news organizations to fully recognize and understand the evolving roles that both news producers and active consumers may concurrently play; by contrast, traditional communication models isolate the senders from the receivers of information. During these early years of online news site development, the speed of information delivery and the space allotted to that information were particular issues of interest, with greater emphasis being placed on text-based information. Initially users viewed the Internet as merely serving a companion role to traditional media outlets. Because newspapers, which rely mainly on particular arrangements of words and photographs, were traditionally considered the primary channel of information, the presentation of information online also modeled newspapers' methods of displaying content.

It is important to note that various news organizations – large or small, national or local – had recognized the dialogic qualities that the online medium offered and in consequence had made efforts to implement various novel interactive experiences for their audiences. However, research suggests that, while such transformations in storytelling may seem constructive in theory, the implementation of these presentation styles has proven difficult in practice. In a study of online news producers in the United States, Chung (2007) found producers to be generally interested in utilizing interactive options. However, producers identified various problems that emerge with the provision of interactivity. The heightened workload associated with such presentations of news has made journalism an increasingly labor-intensive job – one with higher expectations related to catering for audiences. Dialogic communication spaces have also enabled some audience members to hijack the online discussion environment – particularly message boards and forums – to express hostility and anger. Often conversations became uninteresting, unrelated, and even offensive. Concern for the quality of discussion online has raised red flags for online news producers; hence many experimented with screening practices and moderated forums or removed such discussion spaces entirely. Still other concerns pointed toward the technological clutter brought about by emerging communication tools that can take away from the actual content of the stories. Additionally, maintaining interactivity in online news publications was found to be costly because the organization needed a more extensive technological infrastructure to fully implement story formats that encouraged interactive experiences. The training of staff to monitor and facilitative interactivity presented yet another burdensome expense.

Overall, while some concerns were attributed to costs, the main hurdles to achieving interactivity had to do with the changing roles and expectations of news audiences as their members become more active participants online. Chung found that certain news organizations were more innovative in their approaches, while others adopted more cautious methods. In addition to the above-mentioned practical barriers that have hindered the implementation and adoption of interactivity, these patterns reveal differences in news organizations' philosophical approaches to the role of the newsroom. In general, independent media organizations and smaller, local news media were more enthusiastic about supporting forms of interactivity that engaged news audiences as informational sources and also allowed them to participate in dialogic communication.

In discussing different types of online journalism, Deuze (2003) identified a continuum ranging from superficial interactivity in editorial content to deeper kinds of public connectivity. In most mainstream journalism sites' online portals, the content is generally aggregated with extensive editorial content and limited forms of participatory opportunities. Here news sites offer mainly navigational interactivity, which allows news audiences merely to browse a site through the use of hyperlinks or menu bars. Deuze has argued that mainstream news media have not only merely transferred their content online, but that, in the process, these media have also imported their traditional journalistic culture into the online climate. Boczkowski (2004) also observed that early online newspapers have "neither ignored nor wholly embraced electronic publishing" (p. 20) but have "embedded as much sameness as possible while building something supposedly new" instead (p. 20).

Over time, online news publications have indeed become more sophisticated through the adoption of deeper content and increased multimedia features (Salwen, 2005; Greer & Mensing, 2006). The development and accessibility of broadband and newer media tools also contributed to such advancements. However, media scholars expressed continued concern over the limited opportunities that organizations have made available to news audiences for the latter's participation as engaged citizens.

The Engaged Audience: Interactive Features and Blogs

The previous section assessed how online news publications have integrated interactivity and its functionality in their presentation of news. The current section addresses how these interactive news presentation styles are used and received by news audiences. Christians and colleagues (1993) have declared that, when news audiences are finally invited to join the debate as conversational partners, they will awaken and function as competent citizens in society. The Internet and Web 2.0 tools seemingly offer such opportunities for news organizations. As Outing suggests (1998), online news publications can excel at bringing humans closer together by extending options for conversations and exchanges of opinions among citizens.

In this digital age, news organizations have the unique opportunity to facilitate discussion and dialogue among their readers. Literature suggests that citizens' interactions with media institutions and citizens' collaborative production of journalism with news professionals can lead to various positive outcomes. For example, Ball-Rokeach, Kim, and Matei (2001) argue that collaborative storytelling has transformative potential – namely potential for facilitating feelings of belonging and attachment: for example, people in a neighborhood can evolve from being occupants of a house to being members of a community. These researchers studied residential areas in Los Angeles where they tested the communication infrastructure model, and they eventually found that a system that involves residents, community organizations, and local media through an active and integrated storytelling system was the most critical factor in creating feelings of belonging. Further, Rojas, Shah, Cho, Schmierbach, Keum, and Gil-De-Zuniga (2005) also found that media dialogue, or participation in a discussion forum for example, contributed to awareness of an issue even more than content by itself, and also contributed to increased willingness for further engagement. Additionally, Shah, Cho, Eveland, Jr., and Kwak (2005) found that using the Internet as a resource and as a forum strongly influenced both civic engagement – often even more than its traditional media counterparts (print and broadcast media) did – and interpersonal communication.

The implications of the studies mentioned above are significant in that they highlight the potential positive outcomes (social capital, civic duty, civic engagement) of dialogic communication, especially online. These findings suggest the need for a more extensive examination of how news media can strategically use various types of new interactive media features to engage news audiences through community discussions.

While there has been much criticism of online news publications' lack of provision of meaningful interactivity, there are conflicting research results regarding the extent to which online news audiences actually make use of such features. General findings on audiences' activities online show that 44% of Internet users have created content such as photographs, stories, and audio or video files (Pew Internet & American Life Project, 2004). More specifically, the Pew Research Center for the People and the Press (2006) monitors online news audiences' use of search engines, alerts, and news updates. Reports issued by the Pew Internet & American Life Project track audiences' engagement with online news videos (2007a) and their comment-posting activities in online news group forums (2007b). Over the years, studies have offered general portraits of online news audiences – who their members are, what uses they make of online news sites, and why they visit online news publications (see Ferguson & Perse, 2000; Papacharissi & Rubin, 2000; Pew Internet & American Life Project, 2003; Pew Research Center for the People and the Press, 2006).

A few scholars have made efforts to further understand the online news audiences' uses of interactive options. For example, Ye and Li (2006) examined how much online news audiences participated in opportunities that facilitate the democratic deliberation of ideas. They found that a majority of online newspapers they examined

supported a limited number of public forums. They also noted the relatively low levels of user involvement in existing forums. Ye and Li concluded that online newspapers have yet to develop into spaces that can advance democratic public discourse. While there appears to be potential for this kind of active engagement online, Internet newspapers offered few channels – such as online public forums – to help their readers engage in dialogue and in conversations with other individuals.

Chung has conducted various studies examining online news audiences' uses of interactive features. In classifying various interactive features commonly found on news websites, Chung (2008) found that online newspaper audiences frequently use features that increase their choice and selection experiences. However, features that call for more active involvement – getting involved as a source of information – were utilized significantly less frequently. Chung states that interactivity is not a homogenous concept and can be promoted through various interactive features that lead to distinct user activities. For example, video links offer news consumers a visual way of experiencing a news story. Users may also engage in multimedia galleries in order to view photographs that illustrate the stories they are interested in. However, participating in a question and answer (Q&A) forum is a considerably different user experience. An individual may submit a question, and that question may be answered by the participating "guest" of the day. This is often described as vertical communication. Users may also engage in message board discussions that center around a particular topic. In this case, news audiences may converse with other news consumers like themselves. This type of communication is described as horizontal communication. Thus users can choose to engage in an array of different kinds of news consumption experiences.

Chung's study demonstrates that online news audiences may not be making full use of this wide range of interactive opportunities; they are choosing options that demand less investment of time and labor. It appears that the online news audience does not engage equally with all the interactive features offered, especially those that require more effort to be made. More interestingly, certain demographic variables and user characteristics predicted the likely use of specific types of interactive features. For example, people who perceived themselves to be Internet savvy were more likely to use interactive features that involved multimedia technology. Users also carried their offline behaviors online with politically active individuals, and those involved with community organizations are more likely to make use of features that facilitated the expression of ideas.

Additionally, Chung's study recommended that online newspapers should strive to build their reputation for providing credible news, because news credibility acts as a positive predictor for various kinds of interactive feature usage. Establishing trust with audiences encourages them to participate actively and to provide feedback when they seek out news online. This study also reveals that online audiences are not using interactive features as extensively as they could, contrary to the anticipation and predictions of some media scholars and experts in the news industry. Different users seek out different kinds of interactive experiences; thus news organizations need not worry about implementing all the options and tools of interactivity in their online

news publications. In particular, such findings reveal that the potential of, and the need for, interactivity was cast in a rosy light as a result of exaggerated excitement over the results it could promise for audiences and for news organizations.

In an attempt to further understand why audiences use certain types of interactive features, Chung and Yoo (2008) identified three primary motives for visiting online newspapers: information-seeking/surveillance, socialization, and entertainment. They also found that particular motivations led to audiences' preferences for and use of specific types of features. For example, all three motivations were predictors of use of medium interactive features, which increased users' choice and selection options to find and read news stories. However, the information-seeking/surveillance motivation was not a significant predictor of use of features that allowed for customization and interpersonal communication capabilities. Indeed online users appeared to be goal-oriented in their activities and chose specific features to advance their goals.

Additionally, Chung and Nah (2009) investigated the associations between audiences' uses of interactive features offered in various news presentations and their perceived satisfaction with community news publications. Online community newspapers were of interest to the authors because previous literature had focused exclusively on larger metro dailies and some studies have documented that, among the newspapers that publish online editions, a significant percentage is made up of small, community non-dailies. In addition, smaller communities offer greater opportunities for audience-journalist interactivity (Lowrey, 2003).

In this investigation, Chung and Nah (2009) found that overall use of interactive features is positively associated with readers' perceived satisfaction with the community news site. Forums and Q&A features were the few exceptions where positive correlations did not emerge. Further, the authors grouped various interactive features conceptually and found, as a result, that customization features – such as content submissions, letter to the editor, and email byline links – were the sole significantly positive predictor of perceived satisfaction with community news publications. While much literature in the communications discipline reports the significance of human-to-human interactivity that may facilitate democratic deliberation online (Schultz, 1999; Stromer-Galley, 2000; Chung, 2007), this study demonstrates the importance of customization features that allow individuals avenues to express their ideas.

Such findings are initially confusing, given that Chung's (2008) study the year before had indicated that customization features were used least frequently. The findings of Chung and Nah (2009) suggest that the size of a community and its distinct characteristics can influence how certain interactive features are implemented and used. Hence further research should examine such variations among different communities, in order to understand more thoroughly online news audiences' uses of a range of interactive features.

The rise of blogs has also played a key role in the evolution of news online and in the debates over audience participation in the making of news. The entrance of the word "blog" into the Oxford English Dictionary in 2003 signaled the impact of the corresponding reality on the news industry and on society; it also conveyed

the idea that blogs have to be taken seriously, as legitimate forms of public communication. Academics consider blogs to be socially interactive and community-oriented channels and emancipatory tools that have the potential to counter hegemonic processes of traditional information delivery (Herring, Scheidt, Bonus, & Wright, 2004). The practice of linking to and commenting on online resources produces a radically different kind of news discourse from that of the traditional media (Haas, 2005). As blogs are relatively simple to set up and maintain, millions of citizens have created their own personal blogs and thus have acted as informational sources, sometimes even participating in the public sphere as amateur journalists. Much of the excitement surrounding blogs was based on their perceived potential to counter mainstream media coverage and to provide alternative perspectives.

Mainstream news professionals have expressed concern about blogs and bloggers in relation to their objectivity, credibility, and training. However, journalists and bloggers have become increasingly aware of a possible mutually beneficial relationship. For example, bloggers can offer traditional journalism outlets with fresh perspectives and increased interactivity (Lasica, 2003). Kahn and Kellner (2004) describe bloggers as technoactivists who take advantage of, and enjoy, the democratic expression and discussion of ideas. They also suggest that bloggers may function at times as media critics. On the other hand, bloggers can learn traditional news values, rigorous editing, and the importance of original reporting from traditional journalists (Regan, 2003).

While blogs have secured their place in the online news landscape, here too there are conflicting messages in the scholarship, regarding the role of blogs in countering the hegemonic power of mainstream news outlets. Some scholars (e.g., Singer, 2005) discovered that certain blogs have adopted the journalistic role of gatekeeping in order to advance their authority, while others (e.g., Harper, 2005) show that blogs offer audiences an accessible forum for engaging, interpreting, and discussing news issues, and thus for exerting more control. Nonetheless, blogs have become a main staple of online newspapers and have fueled the popularity and success of online news publications. Blogs have allowed ordinary citizens to voice their opinions and perspectives as individuals and as members of different communities, and hence to challenge the authority of the mainstream press. Harnessing the availability of new, interactive tools, individual citizens are now able to contribute their own stories and interpretations of events to the public sphere.

The visibility of blogs to mainstream society can be attributed to a number of high-profile political cases. Most notable among these events was bloggers' prominent coverage and criticism of former Senator Trent Lott's (R-MS) racially insensitive comments at former Senator Strom Thurmond's (R-SC) 100th birthday celebration in December 2002, which forced Lott to resign from his position as Senate Majority Leader. The mainstream press, including *The New York Times* and *The Washington Post*, had offered limited coverage of the event. But, once Lott's remarks appeared on a popular blog, the story was circulated in the blogosphere and received a great deal of attention among bloggers, which subsequently fueled the mainstream media, directing their attention to this story.

Blogs have also proved to be influential during the national and international disasters of 2005. Mainstream media took advantage of blogs during the London bombings, from which it received 22,000 emails and text messages, 300 photos, and several video sequences (Douglas, 2006). As demonstrated during the London bombings, it was for the first time that citizen-produced coverage was considered more newsworthy than professional material (*ibid.*). Blogs also played a critical role during the Katrina disaster that same year. News media organizations used blogs to communicate constant updates of these events and to share compelling perspectives from ordinary citizens. The incorporation of this citizen-produced content in the space of mainstream news had significant implications: now the agenda of traditional journalistic operations must make room for citizen-generated coverage. Whereas content production was once considered an exclusive function of the mainstream press, ordinary citizens are now able to produce it more quickly and in more compelling ways than the mainstream media. For example, Delwiche (2005) examined stories most often linked to by blogs in 2003 and found that, aside from stories about the Iraq War, there was little correspondence between the media that the blogs linked to and the issues that appeared on the blog agenda. He concluded that there was an erosion of a unified media agenda, which presumably happened because bloggers seemed to construct an alternative agenda within the blogosphere.

Participatory and Citizen Journalism

The emergence of these new information communication technologies has generated greater enthusiasm about audiences' roles as information producers and as agents able to shape the public agenda and the policy agenda. Research also indicates that the use of the Internet carries civic potential and may enable effective collective action (Shah et al., 2005). Thus, news producers hoped to employ online media tools so as to bring audiences "closer" to the news and, in the process, to build and regain the public's faith in the credibility of the news media, which has been diminishing quickly over time.

Many believe that news publications' embrace of various interactive new communication technologies unleashes increased opportunities for individuals to become involved and engaged as active citizens of society. Audiences are becoming more active in their roles, as is evident in their growing participation in commenting, sharing, rating, tagging, and even producing news (Picone, 2007). Web 2.0 technology has made it easier for audience members to generate their own content (user-generated content) and become prosumers (producer-consumers) of information.

Specifically, "participatory journalism is the act of a citizen, or a group of citizens, playing an active role in the process of collecting, reporting, analyzing, and disseminating news and information" (Bowman & Willis, 2003). Participatory journalism takes place when news audiences supply content independently of professional

journalists, yet professionals ultimately publish and market the news product as a whole (Nip, 2006). South Korea's OhmyNews is a representative example of participatory journalism. As Korea is one of the most wired nations in the world, nearly everyone there has high-speed Internet access, and its broadband network is also the fastest and most developed in the world (McCurry, 2010). This online environment enables a growing interactive approach to participatory news – one where citizens who register on the site can serve as reporters and information providers. OhmyNews's founder, Oh Yeon Ho, was determined to counter the eroding journalistic culture in South Korea and to revitalize it (Allan, 2006). Indeed OhmyNews has been remarkably successful and has become one of the most powerful news sites in the country, directly challenging established media outlets of the traditional sort.

Newer information communication technologies have thus facilitated a kind of journalism in which the formerly distinct roles of information producer and consumer are increasingly blending. However, the extent of the participation and engagement offered depends on the type of interactivity permitted by the owners of the news sites. Picone (2007) says that participation is not necessarily enforced; rather, participation may be enabled at different levels and audiences may take advantage of it to different degrees. Thus the fullest participatory qualities of online news publications may be practically unachievable, or even undesirable (Project for Excellence in Journalism, 2007). Deuze, Bruns, and Neuberger (2008), however, found support for successful participatory relationships. In their investigation, they found that several news sites have managed to sustain and stabilize their online presence through the provision of participatory features, and these features have helped news sites to generate relevant and important news, thus pointing to the legitimacy of participatory forms of journalism.

Yet, to a large extent, participatory forms of journalism rely on the very mainstream news organizations that they seek to critique and expose. In the process of evaluating mainstream media, they further reform and combine existing ideas and new perspectives from both the traditional press and the new information producers, namely from news audiences. Thus the idea of journalism becoming a channel for conversation rather than a one-way lecture is beginning to find a foothold among journalists and news audiences, albeit it is not brought to full fruition. The increased possibility for users to generate customized content and participate in the production of news is altering the relationship between news organizations and their readers.

A growing number of ordinary citizens have also contributed their views as citizen reporters or amateur journalists, delivering stories to their communities through various interactive media tools (Nah & Chung, 2009). The Knight Citizen News Network (http://www.kcnn.org/citmedia_sites/) reports as of September 2011 that there are more than 1,200 citizen media sites, covering all 50 states of the United States and other areas of North America. There are different types of citizen reporters engaging in content contribution at various levels. Some merely post their thoughts or add comments to news publications. Some produce news content side by side with professional journalists. Still others also participate in the news-making

process through major news organizations' websites and/or citizen-based news media (Nah, 2008).

Nip (2006) describes this movement, which is based on citizen participation, as the second phase of public journalism, a phase that has been largely facilitated through interactive electronic communication tools. Nip argues that citizen journalism offers ordinary individuals the opportunity to influence the news agenda and to take control of the production and distribution of news, which departs significantly from predecessors such as traditional, public, interactive, and participatory journalism.

The increasing reach of online news and the subsequent popularity of blogs have demonstrated that many news consumers are open to interactive opportunities that allow for more active experiences in the reading and interpretation of the news. The Internet has increasingly come to be defined as a platform for user-generated content (UGC), and sites such as YouTube and Wikipedia are offering consumers avenues to publish comments, photos, and videos online, thus encouraging new forms of participation from ordinary citizens (Hermida & Thurman, 2008). Contributions from news audiences to online news sites come in various forms, such as online submissions of news stories and cell phone images of eye-witness accounts. Oftentimes, citizens are simply quicker and already on site, able to provide fresh perspectives and visuals – especially during crisis situations. In fall 2008, the micro-blogging tool Twitter was used during the Mumbai bombings in India to inform fellow citizens about the location of nearby hospitals, blood transfusion sites, and the whereabouts of family and friends. This kind of citizen-produced coverage often created alternative perspectives and generated a greater sense of community than the sensationalist perspectives of the mainstream press.

Such changes in the dynamics between the traditional senders and receivers of information have challenged professional journalists to re-evaluate their roles and their news practices (Chung, Kim, Trammell, & Porter, 2007). Furthermore, these changes have affected news audiences' perception and reception of news. Online news publications, powered with various interactive features and social media tools, are providing audiences with more engaging and meaningful news experiences. For example, social bookmarking tools such as Delicious (<http://delicious.com>) for web resources and Flickr (<http://www.flickr.com>) for pictures allow news audiences to store and share with other users news of their own liking, through the web, rather than consume news that is filtered to them through traditional media channels. Thus individually customized news preferences may be propagated to mass audiences much as they have to traditional news media sources. Such tools provide important opportunities for news audiences to participate in information production, which has traditionally been confined – or restricted – to the journalistic profession. These features are part of a larger collection of tools, called social media, which have also contributed to strengthening the shift toward participatory and citizen journalism.

The Project for Excellence in Journalism (2007) reports the results of a study that compared the news agenda of the mainstream press with the news agenda featured on three prominent news user-sites – Delicious, Reddit, and Digg – during a random week.

The study investigated whether citizens defined news differently from professionally trained mainstream media journalists; it also examined what individuals do with their newfound power to act as disseminators of information. The findings from the study show that the news agenda of the three user-sites was significantly different from that of the mainstream media. Many of the user-selected stories that appeared in the three sites did not appear anywhere as top stories in the mainstream press. The stories on user-sites also had little follow-up and appeared only once. About 70% of the stories on user sites came from blogs or other social media sites, such as YouTube.

Most interestingly, this study found Delicious to have the most fragmented mix of stories and the least overlap with mainstream news topics (3%). Delicious drew more from blogs and non-news information sites than the other two news user-sites. Digg users drew from blogs more than from any other source, while Reddit's information sources were more evenly distributed among blogs, mainstream news media outlets, and non-news sites. The study concludes that the news agenda for news user-sites was not only more diverse in terms of story topics, but also more fragmented in terms of story sources. The authors state, however, that this does not necessarily point to the audiences' disapproval of mainstream media, but rather to the potential of user-sites to act as supplementary sources of news.

Chung and Yi (2009) also conducted an investigation into the selection and sharing of news stories from Delicious in order to identify the most frequently consulted news information sources and topics among news information consumers. Their findings document the diverse nature of the stories collated on this site – both from traditional mainstream media outlets and from new media channels. Social media sources and blogs in particular are growing as major news sources. As in the study reported above from the Project for Excellence in Journalism (2007), prominent traditional news media were not used exclusively, and the sheer volume of uncategorized pages suggests that online news audiences are considering alternative web pages encountered during casual navigation as sources of news. The authors conclude that the definition of news for online news audiences is becoming increasingly broad and complex as unclassified sources dominate tagged stories. It also appears that new information sources are compensating for deficient story topics in the mainstream media. Thus this study adds to the growing literature that documents an increasingly active news audience, seeking out news online in different ways. Information consumers are now able to participate as independent agents, if they so choose, and thus to contribute to the discussion and dissemination of ideas.

Challenges Ahead

As Chung and Yi's (2009) study illustrates, new interactive tools facilitate more active user experiences for news audiences. However, such studies have important implications for traditional communication theories and for the discussion of core issues

such as source credibility. In addition, these results raise questions about the fundamental matter of how to define the boundaries of journalism, given that audiences' views of news are evolving in the current media landscape and these changing perceptions of news will continue to challenge traditional journalism and its perceived authority. As news migrates online and technological advancements provide users with newer communication tools and with a multitude of novel user experiences, the practice of journalism today is in constant transition.

Additionally, a greater role for the audience as an active participant in influencing the form and content of news must also be accompanied by a greater sense of duty and responsibility. Online news audiences, empowered as they are with a broad array of interactive tools designed to help them offer their opinions and tell their stories, must draw upon a variety of information sources in order to separate fact from commentary. Individuals are now bombarded with information from unverifiable sources; hence the veracity of online news content is often questionable. Studies have found a positive relationship between the frequency of visits to a site and audiences' perception of the credibility of its content, which shows that the trustworthiness of a site is strongly related to how often one uses it (see Wanta & Hu, 1994). For example, research shows that, overall, most patients who suffer from cancer and use the Internet as a source of health- and cancer-related information have positive information-seeking experiences and they find the information credible (see Mills & Davidson, 2002). Online news audiences must be aware of these connections between use and perception and should be cautious about ascribing too much credibility to all online sources. Instead they must be mindful to gather news and data from a diversity of sources, including both traditional and newer media channels, in order to ensure that their information pool contains competing and alternative perspectives.

As the agenda-setting function of mass media is eroding and gatekeeping practices are no longer exclusively restricted to traditional media outlets, online news audiences are exposed to, and thus may develop, different agendas from those developed by consumers of traditional media outlets. Several studies note the potential of new communication technologies to contribute toward the fragmentation of news audiences (Katz, 1996; Sunstein, 2001). More options related to content choice and selection, along with the ability to act as sources, allow users to personalize their information environments, which may lead to the neglect of critical public information. Thus citizens may come to be ill informed about important current events and political issues (Katz, 1996; Sunstein, 2001). Such processes are of great concern to some media scholars, as the mass media have long facilitated shared collective experiences and have offered common symbolic anchors for making sense of politics and of public life (Althaus & Tewksbury, 2002). Critics, however, also note the potentially positive outcomes of online news consumption as greater in-depth exposure to particular topics might enlighten and help readers become more educated experts on those topics. These citizens may gain specialized and deep knowledge on a certain set of issues rather than shallow, superficial information on a broad range of issues (Althaus & Tewksbury, 2002).

Other pressing questions include online news audiences' experiences with social media tools, as major news sites are now linking their pages to social bookmarking and social networking features. These are critical questions, since social networking, for example, has surpassed even the largest circulations (or viewerships) of mainstream media. At the time of writing, Facebook boasts more than 750 million active users. A year before that it had 400 million active users, thus demonstrating that its users have nearly doubled within the past year. *USA Today* and *The New York Times* reach just over 1 million readers. As of September 2011, Facebook also reports that more than 30 billion pieces of content, such as web links, news stories, and blog posts, are shared each month. Research also reveals positive relations between the intensity of online social network participation and civic engagement and political participation (Valenzuela, Park, & Kee, 2009). Therefore news publications should consider the potential of social media to retain and attract readers, especially at a time when online audiences are actively creating and maintaining relationships and sharing information through such platforms.

Today's news environment is one of the most unsettling for journalists, but perhaps also one of the most exciting – both for journalists and for news audiences – as news is moving toward a model of audience connectivity. Ultimately, the most important challenge for journalism today is to foster a more meaningful consumption of news and to find ways of revitalizing the relationship between the press and its audiences. Rather than focusing on the distinct roles of senders and receivers, it may be more fruitful to examine the changing media climate and the emerging tools that are available to enable journalists and citizens to work together in order to produce more meaningful and resonant stories. Kolodzy (2006) says: “participatory or citizen media is a convergence strategy that news audiences are using to get journalism back to its roots” (p. 4). Today's journalism requires creative strategies to think about more effective ways of producing and delivering news, incorporating technology and innovative tools, and including diverse new sources to help individuals become citizens in a global society. Most importantly, audiences should be invited to participate in this challenging endeavor.

Participation Beyond Production

Possibilities for Reception and Ritual in the Study of Activist Audiences

Jennifer Rauch

ABSTRACT

In an era of “social media” technologies, instrumental goals such as networking, organizing, and information-sharing hold great sway over the study of activist culture. Researchers often conceptualize activists’ media use as participation in message production and dissemination, while overlooking practices related to reception and interpretation – that is, activists as *audiences*. In this chapter I propose that the moments in which activists engage with media as listeners, readers, and viewers are just as interesting to scholarship as those in which people create and/or share media relevant to activism. By shifting some emphasis from the transmission mode of activists’ media use to the ritual or symbolic dimension, we can better understand how media habits help sustain activist identities and a sense of belonging, which serves as a precursor to participation. I also assert the importance of low-tech media, face-to-face communication, and offline participation among such audiences, whose members aim to connect mediated activities with real-world ones, and identify some social limitations in technological activism. The chapter concludes by suggesting avenues for future study that explore why activists choose to receive certain messages and how ritual contributes to people getting and staying involved with activist communities.

“We the Media.” “Be the Media.” “Become the Media.” When we think of activist media use, we tend to focus on practices related to producing and disseminating messages of social change as embodied by phrases like these. Such slogans have become so widespread since the turn of the twenty-first century that they’ve been espoused by everyone from punk-rockers and political activists to communication professors and tech gurus to media critics and professional journalists. For example:

- In 2000, one-time Green Party presidential candidate (and singer for the Dead Kennedys) Jello Biafra ranted against globalization in a spoken-word album called *Become the Media*, a motto also used by Jen Angel, the social activist inspired by World Trade Organization (WTO) protests in Seattle to launch *Clamor*, an award-winning magazine of radical culture.
- Dan Gillmor, a technology writer for the *San Jose Mercury News* who chronicled the dot-com boom and bust, focused on citizen journalists and bloggers in his 2004 book *We the Media*, which helped popularize the notion of the “former audience.”
- The 2009 handbook *Be the Media*, whose logo depicts an upraised fist clutching a microphone, features contributions and endorsements from the likes of Ben Bagdikian, Jeff Cohen, Rachele Kanigel, Kevin Kelly, Robert McChesney, Craig Newmark, Douglas Rushkoff, Norman Solomon, and Pete triDish.

More people are probably participating in media production and dissemination now than in the pre-Internet era, especially through new technologies that were once called “alternative” media (see Hamilton, 2001). The very concept of participatory communication, once an alternative model trumpeted by activists, has gone mainstream (e.g., Bowman & Willis, 2003). In an atmosphere of increasing fragmentation, interactivity, and convergence, the formation called “audience” may look like it’s evaporating. While some talk about the “people formerly known as the audience” as though they are extinct (see Gillmor, 2004; Rosen, 2006), others propose alternative categories such as “produser” or “prosumer,” which collapse the producer or professional and the user or consumer. Nonetheless, even people who engage with media at some moments of their lives as transmitters of information – including activists, whether as amateurs, native reporters, citizen journalists, or professional communicators – are, at other moments, readers or viewers or listeners of media. And those moments of reception matter a lot.

While activists are, undoubtedly, just as active in the production and distribution of content as anybody else – and arguably even more so – I would like to defend the “audience moment” in the media experiences of people who are working for political or social change. Audience moments are important because they represent instances wherein individuals have chosen, from the vast array of available media, to receive and pay attention to particular messages relevant to activism. Such acts might or might not lead people to create their own media responses or further circulate the activist content that speaks to them. It is likely that many audience members will subsequently become media producers or distributors – but first they must attend to such messages in the

original form. Activists can be defined as people who care enough about issues to devote time and money to their causes (Oliver & Marwell, 1992) – in which case audience activities such as subscribing to alternative publications or paying attention to community broadcasts can play a central role in social change.

Reader-reception, active audience, and ritual theories offer many useful approaches for studying such audience moments. Especially interesting, to my mind, is the role played by media in activists' daily lives, in what James Carey (1989) has memorably deemed the "ritual" mode of communication. Most work on activist uses of media has privileged the transmission mode, perhaps because activism is typically understood in instrumental and goal-oriented terms. One might argue that sitting on a sofa reading *The Nation* or *Human Events* is a passive activity and that audiences aren't "really" activists unless they're waving placards in the streets or sending online petitions or posting on political blogs. But such a limited stance does not hold up to close scrutiny. Choosing to read alternative media instead of the mainstream ones that dominate our culture is an intentional act of communication that can contribute incrementally to the creation and sustenance of activist identities. Thus I propose shifting the emphasis of media studies research on activism from the transmission or instrumental uses of activist media to ritual or social ones, which help build and maintain audience members' connections – both informative and affective – with activist networks, thus strengthening individual commitments and group solidarities. In other words, activist media do not only produce texts; they also produce communities.

This chapter begins by considering activists as transmitters of information, with an overview of the literature whose conceptual and methodological frameworks emphasize media production. Next I examine the implications of the research gulf between activist producers and their audiences, wherein intersubjective meanings can be overlooked and media effects taken for granted. After discussing recent empirical work on such audiences, I examine how ritual acts of media consumption in interpretive communities help build commitments and sentiments that might spur activist participation. Then, in light of the social limitations of online activism, I reassert the importance of scholarship that has focused on low-tech media audiences, face-to-face communication, and offline participation. I conclude by offering avenues for future study and by urging more attention to be paid to activist audiences in general and to the ritual aspects of their media consumption practices in particular. Such research can contribute to knowledge about why and how people use activist and alternative media to get and stay involved with activist communities; such knowledge is useful not only to advance academic discussion but also to inspire and improve forms of social action.

Untangling Activist and Alternative Audiences

The primary focus of this essay is *activist audiences* (as opposed to active, or even interactive, ones) and, to a lesser extent, alternative media that are central to the

activism. The terms *activist* and *alternative* are often used interchangeably, including as a descriptor for media, but they're not necessarily the same thing (Waltz, 2005). I understand activist audiences as people who care enough about (a) given issue(s) to regularly seek out and consume information beyond what's available in mainstream press coverage, and who take intentional actions to effect social change on the basis of those messages; the resultant actions might or might not include producing and participating in activist media. It follows, then, that activist media aim to bring about social change; that they engage in structural analysis concerned with class, gender, ethnic, or other forms of domination; and that they are committed to democratic communication principles such as popular access, participation, and self-management (Huesca, 2008, p. 9). By comparison, alternative media are often recognized for featuring critiques of mainstream media, espousing non-commercial or non-profit orientations, and providing counterinformation for sociopolitical action (Rauch, 2007). Activist media and alternative media are more alike than different, especially in terms of promoting participation in activism (an advocacy function that once set these two forms of media apart from mainstream journalism – now, perhaps, a fading distinction), to the extent that the former can be treated as a subset of the latter.

Hallmarks of activist audiences include a commitment to alternative media, a belief in the need for mobilizing information, and involvement in real-world events such as protests and campaigns that in turn influence how activist audiences interpret media content. Activist audiences resemble the general public in many ways, for instance in their capacity for active interpretation and in their use of mainstream news sources. Although there is substantial overlap between the categories “activist audience” and “alternative audience,” the two are not entirely equivocal. Research suggests that, while many activists prefer to symbolically distance themselves from corporate and commercial media, in fact they use more news sources, both mainstream *and* alternative, than the average person (Boyle, 2005; Rauch, 2007). The audience for activist and alternative media products sometimes includes people who accept mainstream politics and don't engage in much activism, but it is likely to be comprised mainly of people who self-identify as activists.

Activists as Transmitters of Information

The Independent Media Center movement, which pioneered activist uses of the Internet, is a robust example of modern participatory media (Wall, 2002). Usually called IMC or Indymedia, it was founded in Seattle in 1999, as a clearinghouse for independent or citizen journalists documenting World Trade Organization protests. The Seattle IMC was remarkable for reporting evidence that police used sub-lethal weapons against demonstrators at a time when mainstream media like Cable News Network (CNN) denied this had happened. Its work became a “prototype for a global

anti-corporate domination social movement that will increasingly rely on the Internet" (ibid., p. 40), and thus an influential antecedent of Occupy Wall Street Independent Media Centers (IMCs). These IMCs are based in hundreds of cities on six continents and mainly publish information online, but they have also launched a handful of radio stations and newspapers in English and Spanish, as well as a TV show. People consider Indymedia "activist," in terms of both form and content: an open-publishing model, citizen journalism values, and coverage of under-reported issues and events – especially protests (Atton, 2004; Downing, 2003b; Haas, 2007; Kidd, 2003; Pickard, 2006; Platon & Deuze, 2003; Wall, 2002; Waltz, 2005). Indymedia are examples par excellence of participatory communication axioms such as "Become the Media."

Literature on the Indymedia phenomenon illustrates how scholarship tends to explore the motives and practices of activist producers, and the content they produce, more vigorously than it explores their audiences. This trend goes back at least to the 1960s, when histories of that decade's activism typically centered on the activities of editors, writers, and artists for the alternative press while neglecting the role that readers played in the successes or failures of that press. More recently, scholars have begun to focus on activist networks that produce and circulate media – overwhelmingly, through new channels such as the Internet (e.g., Arquilla, Fuller, & Fuller, 1998; Atton, 2002b; Bennett, 2003; Castells, 1997; DeLuca & Peeples, 2002; Dunbar-Hester, 2009; Friedland, 1996; Kahn & Kellner, 2004; Redden, 2001; Ronfeldt, Ford & Gil, 2001). Other activist transmitters who have received significant attention include Zapatista rebels in Mexico and their transnational supporters, the US movement for public access to television broadcasting, and community radio such as low-power frequency modulation (FM) and the non-profit Pacifica network (Atton, 2004; Cleaver, 1998; De Angelis, 2000; Downing, 2001; Dunbar-Hester, 2009; Eliasoph, 1988; Keck & Sikkink, 1998; Lasar, 1999; Opel, 2004; Ronfeldt et al., 1998; Stein, 2001), with ample research on Occupy media producers and producers now in progress.

A solid body of case studies has explored activist communication strategies for organizing, publicizing, and framing activist issues and events, as well as the constraints that such collective actors face (see Keck & Sikkink, 1998; McCluskey, 2008). For instance, Gamson and Modigliani (1989) took a constructionist approach to media activism aimed at influencing public opinion on nuclear power. Van Zoonen (1992) discussed how the women's movement used media to build a public identity. Ryan (2004) looked at how labor activists formed media campaigns around a Teamsters strike against United Power Service (UPS) in order to communicate messages to a mass audience. These studies often provide useful lessons for activists on how to produce events that draw press attention, how to influence media discourse, and how to create their own representations. In fact, the goal of transmitting messages often takes the form of handbooks for activists, for example *Prime-Time Activism: Media Strategies for Organizing* (Ryan, 1991), *Making the News: A Guide for Activists and Nonprofits* (Salzman, 2003), and *Be the Media: How to Create and Accelerate Your Message . . . Your Way* (Mathison, 2009).

The “Disturbing Gulf” between Activist Producers and Audiences

Communication scholars have told us a lot about activists as producers, which has been a fruitful area of research. But studying producer intentions does not necessarily clarify the roles that publications, programs, or websites play in generating social change or in sustaining activist commitments. The influence of activist and alternative content on audiences is often taken for granted, and questions about how and why readers use such media are often ignored. For instance, in his analysis of Indymedia as a form of radical online journalism, Atton (2004, p. 52) notes that the nature and impact of Indymedia uses by activists and others “remain open to question.” With communication technologies enabling interactivity in so many intriguing and novel ways, activists as audiences get short thrift. “Participation” in activist media is also often muddled with the issue of activists becoming producers of media texts, whereas it could be a serious mistake to reduce “involving audiences” to “creating media creators” (Waltz, 2005, p. 33). Gathering and distributing information is necessary to activism, of course, but it’s not wholly sufficient.

Few empirical studies have looked closely at activists as audiences, a neglect that is problematic considering that social movement organizers and critical-cultural scholars alike seem interested in, and would benefit from, learning how people consume media as resources for activism. John Downing, a leading voice on alternative and activist media, has called this research gap “a distinctly disturbing gulf” between our scant knowledge of how audiences use media and the mass of descriptions and theorizations of those media (Downing, 2003a, p. 625). It’s a paradox, he says, “that so little attention has been dedicated to the user dimension, given that alternative-media activists represent in a sense the most active segment of the so-called ‘active audience’” (*ibid.*).

So why is audience research on activists lacking? The producers of such media might have compelling reasons for not conducting these studies themselves. To wit: activists who launch and sustain media projects, often on a volunteer or non-profit basis, have little time and resources left for pursuing user research; political repression of dissent may dissuade some from implicating their audiences or themselves; others may resist the commercial or marketing paradigms underlying much audience research; or certain activist media producers may simply lack interest in their users (*ibid.*). Activist producers who conduct audience research often do so in pursuit of instrumental goals such as improving outreach, increasing revenue, or expanding readership. The task of examining the broader social or cultural aspects of activist media, then, falls disproportionately on scholars who face their own conceptual and practical obstacles to studying these audiences.

The academic inclination towards media production could be a theoretical one: because audiences are not visibly “doing” anything when they consume alternative media, they’re perceived as passive, or not even recognized as activists. Other biases

against studying activists in the receptive and ritual modes could be methodological. Most work on activist media usage focuses on the efforts of individuals or organizations to promote a message or to influence public opinion – in other words, it focuses on the moment when they’re engaging in transmission. In part this derives from the relative ease with which one can get access to a particular group’s ideas and actions through its website and/or to a group’s spokespeople in order to research a case study on, say, Indymedia or Pacifica or Zapatista practices. What’s more challenging is to reach individual members of the activist audience in those diffused moments when they’re using alternative media in a ritual mode. It’s simpler to persuade key members of a group, especially one that’s “trying to get a message out” anyway, to cooperate with a research project that might help publicize that message and recognize their work. Individual audience members are less willing to spend precious time participating in a study – unless they’re given an incentive, usually financial – and there are too few academics who can afford to give one.

Scholars might find it more difficult to study activist audience members (who are anonymous and dispersed throughout society) than activist texts (which are fairly convenient to collect and analyze) or activist producers (who are easy to identify and contact through their organizations or online presences). Audience research projects are time-consuming, labor-intensive, and unattractive to major foundations that prioritize mainstream media over alternative ones. And, as any activist can attest, papers are easier to organize than people. The prospect of gaining access to real people, especially strangers, might be daunting – though researchers interested in social change likely have affinities with activists working to create it. Such practical problems are surmountable when people have the will to overcome them, as is proven by the fact that researchers have already produced a great deal of empirical work looking at media reception, consumption, interpretation, and use by other audiences.

Current Approaches to Activist Audiences

Activist scholarship can learn much from reader reception and active audience theories, which propose that subjective meanings are actively created in the minds of people who read, listen to, or watch media – rather than assuming, as the instrumental view of communication has tended to do, that producers transmit objective media messages that are received and acted upon by the audience. The field of audience studies has benefited from interpretive analyses that explain how people use media, how they make sense of polysemic messages, and what the rituals of media consumption mean in people’s everyday lives (Lindlof, 1987b, 1991; Radway, 1991; Bird, 2003). This research has already brought to light the pleasure, creativity, and emancipation that some people find in using everyday media products such as soap operas, tabloid newspapers, and romance novels. The meaning of these media genres is often tied to their symbolic or ritual uses and to the collective sense of community they

create. Audience researchers have not yet paid much attention to similar uses of, say, the alternative media genre by activist readers and viewers.

Among the few studies to consider the potential implications of message reception for activists is a content analysis that identified the theme “we are not alone” in alternative press coverage of protests (McLeod & Hertog, 1999). The study concluded that such content increases the knowledge of activism’s potential within a group, links radical movements nationally and internationally, provides information and inspiration to mobilize future events, and conveys a sense of community (*ibid.*). Rather than gauging audience attitudes or behaviors through empirical methods, however, this research assumed that opportunities for exposure to such positive frames would yield these effects. Some uncommon surveys of alternative media users by Boyle have generated equally interesting insights. One study confirmed that activists use both a greater number of alternative media *and* a wider range of news sources than non-activists, challenging the perception that activists avoid mainstream media (Boyle, 2005). Another study found that use of alternative media such as protest websites was positively related to participation in protests (Boyle & Schmierbach, 2009).

Another notable study aimed to measure activist audiences for Indymedia content in order to determine how many people were reading news on this alternative outlet during the US invasion of Iraq (Opel & Templin, 2005). Internet server reports showed a spike in traffic at several IMC websites around March 2003, as activists and other audiences sought out information about the military action from sources outside the mainstream press – a finding that suggests connections among alternative media use, periods of crisis, and activist mobilization. In their attempt to collect this audience data, however, the scholars faced resistance from some Indymedia producers, who likened the researchers’ request for user information to government surveillance *à la* Patriot Act. Opel and Templin concluded that the Internet’s power to monitor users “is viewed with a fair degree of suspicion by many within the IMC community, and that this suspicion presents a significant research barrier to further analysis of server traffic reports” (p. 15).

Despite occasional obstacles to gaining trust from community members, which is a concern common to all audience research, more such quantitative work is welcome. It’s crucial also to explore the audience dimension of activist media use via *qualitative* analyses, whether in a critical, cultural, social–constructionist, or interpretive vein. Focus groups, long interviews, and ethnographic methods have been widely used and proven useful by scholars in reader-response and audience research who contextualize audience members’ media consumption in relation to their lived experiences (Lindlof, 1991). In advocating for research on activist audiences, Atkinson (2005) points to the lessons of feminist and social constructionist theory: that non-quantitative methods can reveal the subjective meanings that participants make when consuming media texts. He argues that such research will help scholars better understand activist audiences, whose members use alternative media both to build a critical understanding of reality and to construct community (*ibid.*).

A rich example of the non-quantitative yet empirical approach is Gamson’s (1992) effort to understand how, if people are generally uninterested in politics or badly

informed about issues, so many of them do become active in social movements. Instead of relying on survey data of college students, as many scholars of public opinion do, Gamson conducted discussions with groups of people working mainly in the service industry or in clerical and office jobs. In their conversations about controversial issues such as nuclear power, affirmative action, and the Arab–Israeli conflict, his analysis identified the seeds of political action in the minds of working-class US citizens. While not intended as audience research *per se*, this study sheds light on how ordinary people interpret actively mainstream media messages such as op-ed columns, political cartoons, and network news programs – by reference to personal experiences, popular wisdom, and interpersonal conversations – rather than receive them passively.

As another example of the potential of audience research for explaining why activists use certain media and how they interpret them, consider my discourse analysis that examined how US activists articulated the “third-person effect,” a widespread perception that others are more influenced by media messages than one’s self is (Davison, 1983). This approach contrasted with the surveys and experiments prevalent in much third-person effect research: groups watched a news program and responded to non-directional questions in a naturalistic context where activists were allowed to express mobile and conflicting identities (Rauch, 2010). These activists, who reported feeling better informed about current events through their alternative media use in comparison to those who relied primarily on mainstream media, identified themselves, in alternation, as invulnerable *and* vulnerable to media influence. Despite distancing themselves from a “mass” audience, participants used discursive strategies such as role-playing, inventing dialogue, and posing hypothetical statements to imagine themselves as also being susceptible to mainstream news.

A large body of qualitative audience research has shown that groups whose members share specific psychological factors, social behaviors, or media orientations – as many activists do – tend to receive media texts in a distinct range of ways. For example, it is likely that activist audience members (1) select different media content (e.g., a greater proportion of alternative or activist content) from that selected by the general public; (2) interpret mainstream media messages in different ways from non-activist audiences; and (3) take different action from what other groups do, as a result of having been exposed to activist messages. Engaging in more rigorous audience research on activist audiences could make useful contributions to understanding both how social-movement messages are received, interpreted, and acted upon in the transmission mode and how activist communities are built and sustained through ritual communication.

Theorizing Activist Audiences as Participants in Ritual

As a prelude to discussing ritual and transmission modes of communication, I will offer some clarification of those terms here. *Ritual* refers to a symbolic act that brings people together in fellowship through the “creation, representation, and celebration of shared even if illusory beliefs” (Carey, 1989, p. 43). On the other hand, *transmission*

denotes “the extension of messages across geography for the purpose of control” – to employ a transportation metaphor (*ibid.*). According to Carey, the first conception emphasizes meaning, culture, and the maintenance of society in time, whereas the second stresses information, power, and the efficacy of communication across space. The transmission view, which tends to draw attention to discrete instances of demonstrable effectiveness and to yield case studies of successful media projects, has, to date, exerted a disproportionate influence on activist research. I’m not suggesting that transmission is bad and that ritual is good – Carey didn’t either – but that a fuller understanding of activist media requires both.

Carey keenly observed that empirical communication research has long embodied the transmission metaphor rather than the ritual one, a trend recurring in this literature on activist media. He thought that the continuity and coherence of communal life depended on resolving the tension between ritual and transmission views. Indeed, communicative rituals coexist with, and can serve as precursors to, instrumental acts; in other words, they can activate inquiry and direct action. “The purpose of news is not to represent and inform but to signal, tell a story, and *activate inquiry*,” Carey said (1989, p. 82; my emphasis). He shared Dewey’s belief that the extended, impersonal webs of relations in postindustrial “great society” should be converted into more intimate, geographically bound ones of a “great community” through communication. This strengthening of weak ties would build social capital, “so that genuinely shared interest in the consequences of interdependent activities may inform desire and effort and thereby *direct action*” (Westbook, 1991, p. 309; my emphasis). Audiences need facts and information, of course, but they also need discursive and interpretive resources to aid them in forming opinions, following arguments, understanding other people’s viewpoints, and debating the alternative goals that a community might formulate and pursue.

One must note that the power of ritual – as a set of practices, as an object of study, and as a tool for criticism and social change – has been questioned on several fronts. Ritual practices are sometimes seen as politically dangerous, anachronistic, conservative, arational or irrational, or as the politics of spectacle (Cottle, 2006). Ritual studies are sometimes criticized for promoting an uncritical, orderly, and homogeneous view of society or for disregarding power, ideology, and resistance (*ibid.*; Atkinson, 2005). Some scholars have equated an instrumental orientation with “active” media use and presuppose that a ritualized orientation must be “passive,” leaving little possibility of a dynamic relationship between the two (see Metzger & Flanagin, 2002). Nonetheless, there are persuasive arguments that a ritual approach to communication can serve democratic impulses, since “symbols, emotion, rhetoric and performance are constitutive of human communication” that guides participation (Cottle, 2006, p. 413). The interaction between ritual and transmission modes of communication has proven productive to scholars of activism, including protest studies that use both rational action models and ritual symbol frameworks.

In the twenty-first century, ritual and noninstrumental approaches to communication have found support in research on “affective intelligence,” which explains the

competences and behaviors of busy, distracted citizen-voters (see Marcus, Neuman, & MacKuen, 2000; Marcus, 2002; MacKuen, Marcus, Neuman, & Keele, 2007). Much as Carey and others have clarified the role of rituals in communication, scholars of the “affect effect” have asserted the primacy of emotions like enthusiasm or anxiety in activating political deliberation (Marcus et al., 2000). Empirical tests demonstrate a dialectical relationship between affect and reason that prompts people to engage in thoughtful action, confirming that emotion can have a rational impact and, of course, that reason can yield an affective result. Similarly, reconciling the ritual and transmission aspects of communication might help explain why some people pay attention to alternative media and participate in activism while others do not.

Research on activism also shows that many people find their way into politics through emotionally motivating experiences (Teske, 1997). It follows that activist media practices often employ spectacular rituals to get attention and to generate anxiety about or enthusiasm for causes, in order to strengthen member loyalties and group allegiances (Marcus, 2002). Social change research has, to its detriment, overlooked the relevance of emotion to collective mobilization and individual activation, as Downing proposed (2003a). Renewed interest in the emotive and affective dimension of alternative media use is therefore “crucial” (ibid.). The affective and arational dimensions of activists’ communicative experiences could be fruitfully explored within the scope of reception analysis or ritual studies, drawing on some of the aforementioned knowledge already accumulated in allied fields of study such as sociology and political science.

Contributions of Ritual to Media Research

Various scholars have explored the social, symbolic, and ritual aspects of communication that help build and maintain communities by representing shared beliefs, by enabling civic conversation, and by activating participation. For example, Anderson (1991) looked at the daily ritual of reading national newspapers that helped foster “imagined communities.” Nord (2001) examined how newspaper readers throughout US history have used journalism to form community attachments and to engage in civic life. Rothenbuhler (1998) explained how ritualized media events such as the Olympic games or state funerals do not just reflect group memberships but help define them. Zelizer (1990, 1993) analyzed reporters’ first-person narratives about the Kennedy assassination, which followed the profession’s logic of ritual in first establishing journalistic authority. Zelizer has also studied how journalists’ collective interpretations of Watergate and McCarthyism reveal the ways in which this profession’s narrative rituals help establish journalism’s legitimacy.

Several researchers have drawn upon the concept of the *interpretive community*, a group that shares understandings of social reality, intersubjective meanings, and strategies for decoding certain texts (see Fish, 1980; Lindlof, 1987a; Zelizer, 1993;

Rauch, 2007). These communities include interpretive communities of production, such as journalists or television producers, as well as ones of reception, such as newspaper readers or activist audiences; people might belong to several, even conflicting, interpretive communities. When members share a commitment to certain inflections on behavioral norms and dominant ideologies – as activist audiences often do – interpretive communities can also be considered “subcultures” (Lindlof, 1987a). As Lindlof explains, media audiences that habitually use specialized, deviant, or obscure communications media or media content will tend to collectivize and to form interpretive communities, subcultures, and interest groups (*ibid.*). My own work has considered progressive activists as a subcultural interpretive community, because members of this audience hold similar orientations toward political engagement and they use alternative media, which have the potential to generate unusual interpretations that go against the norm or subversive meanings that threaten the social order implicit in mainstream media content.

Two empirical studies I have undertaken attuned me to the importance of rituals in interpretive communities. The first project interviewed independent publishers of *zines*, small idiosyncratic magazines that usually espouse do-it-yourself aesthetics and participatory ethics (Rauch, 2004). The vast majority of zine producers who talked to me engaged in these modest labors of love not for instrumental reasons – such as earning money or spreading a message – but mainly for affective reasons. They immersed themselves in ritual acts of production, circulation, and reception alike. They enjoyed the feeling of community that springs from sharing and exchanging zines in person, in meaningful everyday contexts. An observation that Waltz (2005, p. 79) makes about zine readers applies also to activists: they seek self-valorization through the consumption of media that mirror their own views and make them feel as if they are part of a social group (albeit one whose members may never meet in person), or that might even challenge their views and identities in ways that help clarify their own beliefs or expand their system of values.

The concept of ritual also proved useful to understanding another interpretive community I studied: an audience of activists involved with the movement “against globalization” or for democratic communication and global justice (Rauch, 2007). This community is rooted in the political ideals of the 1999 Seattle uprising, and it is committed to the communicative ideals of Indymedia (self-described as *grassroots*, *collective*, *anti-corporate*, *democratic*, *decentralized*, and *autonomous*). When I asked activists why and how they used alternative media, I expected, frankly, that they would talk about instrumental or transmissive concerns such as media bias, missing information, and getting the word out. They didn’t. Instead they focused on the role that alternative media consumption played in their daily lives. They said that it connected them to a community of like-minded people and recursively reflected and shaped their identities as activists. Those discussions underscored the important role that just reading, watching, or listening to alternative media – not necessarily producing it – plays in building and maintaining a sense of belonging even in communities that, like this one, prize participation. And, while those activists consumed a great deal of

mainstream news, they ritually downplayed their attention to these sources and performed the role of “alternative media user” when talking to other activists (Rauch, 2007).

Social Limitations of New Activist Media

People interested in activist media often celebrate the power of digital tools and online networks to encourage two-way communication and user-generated content. While activists are surely using new technology in novel and important ways, we must not overlook the continued cultural relevance of old media such as print or broadcasting, which still play a crucial role in connecting message creators with their audiences and in building activist communities. Carpentier and De Cleen (2008, p. 7) explain: “In this dazzling techno-optimism, we often forget that the routines, identities, practices, convictions, and representations that circulate in the old media system have not been lost and still co-structure the new media system.” New media provide an important channel for distributing activist messages – but they are not the only significant channel. I argue that we should retain a high regard for real-world activities, including both old media and unmediated communication, relevant to the audience moment. Following are some examples of research indicating how a renewed interest in older forms of communication, which aligns with some reappraisals taking place under the rubric of “slow media” (Rauch, 2011), could help inform our study of activist audiences.

Activist networks have been using a wide range of means – electronic and other – to exchange “user-generated content” and to create alternative channels of two-way communication for a long time, as Keck and Sikkink (1998) document in their comprehensive study of transnational advocacy groups. While communication has increased in quantity since the 1990s, partly due to new media technologies that speed up information flow and simplify contact between activists, these scholars stress that the formation of such networks relies on conferences and other face-to-face encounters where activists can share information as well as gain trust and discover common concerns (*ibid.*). Their global perspective reveals not only the limitations of techno-optimism, which can overlook the continued influences of interpersonal, print, and broadcast communication, but also those of ethnocentrism, since many regions and communities in the North and the South are less affluent and less dependent on new media than those where many researchers live and work. Legions of activists and proto-activists around the world continue to engage with social-change messages in a low-tech audience mode, whether by attending a conference in Brazil or by reading a pamphlet in Vietnam or by listening to a radio program in South Africa.

In the case of the Zapatista movement in Mexico, transnational activists used information as ammunition in a “social netwar” that helped resist the oppression of

indigenous insurgents (Ronfeldt et al., 1998). New technologies helped enable organizational networking there, but activists also “swarmed,” both physically and electronically, from around the world into the Mexican state of Chiapas to serve as local witnesses to the unfolding events (ibid.). Printed messages, faxes, and unmediated communication through human couriers – along with mixes of old and new media technologies – were also essential to this indigenous protest (ibid.). People studying the Zapatistas and other movements have concluded that the Internet was mainly useful to the extent that it fed an activist mechanism, carried online participation offline, and created “a synergy between the producers and the receivers of information, enabling different groups to make contacts and find new allies” (ibid., p. 116; Wojcieszak, 2009). The worldwide protests against Wall Street that began in 2011 derived their strength not only from information shared through social media but also from physical occupation of public spaces. We would benefit from knowing more about *who* receives activist information and *how* it feeds offline participation – for example whether and, if so, how alternative media actually activate audiences.

This critique of the myopic focus on new technology also rests in part on the assumption that “former audience members,” who visibly participate in activist media by producing (readily accessible) texts, represent the most salient aspects of those phenomena or the most notable audience for those messages. As Atton (2002b) has noted, activist media often aim to give voice to the voiceless and invert the hierarchy of access by developing media spaces where activists and ordinary people might present accounts of their own experiences and struggles. Yet the people who participate in online activist communities likely belong to a subset of “ordinary people” that is not very ordinary; ordinary or unmarked people do not all seek a voice or choose to participate in public media conversations (ibid.). For example, many scholars have studied people who write letters to editors but who, interesting though they might be, comprise a minority compared to newspaper readers who do not write such letters. The desire to participate in media conversations or media production – especially over the Internet – might not be as common among global activist audiences as some assume.

With the costs of new technologies decreasing and worldwide access to them increasing, the efforts of activists and researchers might increasingly focus on the Internet, both to their benefit and to their “peril,” as Wall writes (2002, p. 40). The time is ripe for renewed study of activist audiences from perspectives that take into account the importance of social interactivity versus the technological kind, of techno-skepticism versus unqualified celebration, of cultural diversity versus ethnocentrism, of older forms of slow and unmediated communication versus exclusively digital ones, and of the full range of audience members versus participant-performers who actively mark themselves. These far-ranging concerns should dampen the optimism of Internet boosters who believe that “becoming the media” is the worthiest goal of activism and the most deserving object of scholarship. And Carey – who questioned the cultural import of an electronic revolution that he considered “illusory” and “mythical” – provides many insights that support this reasoning.

Future Directions

This chapter has shown how research on the relationship between media and activism has, to date, provided ample description and analysis of activist producers and their messages. Yet those producers are not just creating messages, texts or products; they are also participating in the production and maintenance of activist interpretive communities. Not all people who participate in activist media do so through acts of production; those communities are equally maintained by acts of consumption, interpretation, and reception. That's why it makes sense for scholars to pursue the following goals: first, a better balance between studies of activist producers and activist audiences, the latter being preserved as a distinct category; second, a better balance between the transmission and ritual aspects of media use by activist audiences; and, third, a better balance between audience uses of old and new forms of media.

Relatively little work has focused on activist audiences, and we can still learn much from examining how they receive the messages that activist media produce. Some research on activist audiences could be placed under the rubric of transmissive communication, by focusing on media content and its effects. Exploring the dialectic of transmission and ritual communication modes is crucial to expanding empirical research on activist audiences and to counteracting the current imbalance toward producers. Neither account suffices without the other. Some of the questions offered here to guide future research could be approached from either viewpoint:

- *Who pays attention to activist media products, and why?* Future research could examine why and how activist audiences (or, less often, mainstream ones) receive alternative media content. This could illuminate media strategies for breaking through to mass media and would be useful, from an administrative perspective, to activist producers trying to understand their messages' impact.
- *What do activists do with the information that they receive from media sources?* For example, they probably use activist (and non-activist) content as resources in their daily lives: for making decisions, understanding personal experiences, managing social interactions, and organizing their time. Scholarship often takes the influence of activist media for granted, but it could profit from more evidence that exposure to activist content affects real-world attitudes or behaviors.
- *How does consumption, reception, or interpretation of alternative media differ between progressive activists and conservative ones?* Though work on activists' media use has focused on the left, activists might subscribe to any political ideology: progressive, anarchist, conservative, far-right, and so on. The little existing research on right-wing activists has focused on nationalists and neo-Nazis (Atton, 2004; Wojcieszak, 2009), the latter being provocative by linking the attitudes of discussion forum users to their offline actions.
- *What kinds of media products do activists choose to consume, and why?* We don't know much about what kind of media activists actually use. Some findings suggest that

they use a lot of alternative media, but also that they use more mainstream media than the general public does (Boyle, 2005; Rauch, 2007).

- *Do activists prefer alternative media to mainstream sources, and why?* We need to consider audience definitions of “alternative media,” a phrase that scholars have explicated in myriad ways (e.g., Atton, 2002a; Rauch, 2007). More empirical work is needed to understand why readers, viewers, and listeners value alternative media and, specifically, their opinions and impressions about the “alternative” qualities of the media they respect and admire.
- *How do activists interpret the messages they read, view, and hear in mainstream or in alternative media?* Studies might look at how activist audiences receive mainstream content – interpreting it against the grain, perhaps – and how they receive alternative content, in cases where activist media are effectively preaching to the converted (and thus embodying a literal meaning of “ritual” communication). Activists’ interpretations of protest coverage would be one rich subject for exploration.
- *How do activist audience groups in various cultures, regions, and socioeconomic conditions consume, receive, or interpret mainstream or alternative media products differently?* Researchers could take a closer look at international activist audiences – especially from developing nations and poorer communities – whose media practices and preferences might contrast with those of affluent US and European ones.
- *What rituals of media consumption or reception do activists engage in?* Do people consume activist and alternative media at particular times, in particular places, in particular audience groupings? Some activist consumption of mainstream or alternative media has an instrumental and rational orientation, while other acts of reception are oriented toward feeling a sense of social connection or collective purpose. Research might investigate activists’ habits of media use more broadly, as well as their rituals in the narrower sense, along with possible contradictions between the two.

Research along these lines on activist audience practices could help (1) draw attention to the role of specific media coverage or events in the birth and growth of movements; (2) address questions about the credibility of activist or alternative news sources; (3) examine alternative media’s influence on users’ oppositional consciousness; and (4) understand the role of emotion and affect in social involvement, as Downing suggested (2003a). Such results would be enlightening not only for scholars of activism but also for members of activist communities.

Conclusion

The dearth of work on activist audiences means that intellectual opportunities abound for interdisciplinary research on this topic from a wide range of theoretical

and methodological perspectives. Scholarship on activist audiences could be pursued in the social sciences or humanities; according to humanist, critical, cultural, or interpretive paradigms; and through the application of quantitative, qualitative, or mixed methods. In particular, ethnographic studies offer the potential to contextualize the reception processes of activist audiences, who bring their preceding identities and wider commitments to bear in media encounters (Bird, 2003). Contextualization is especially important to this area of research, because ritual depends on the willing involvement of media participants who are not necessarily producers:

It only “works” when we want it to, when we volunteer something of ourselves, our collective identities, sentiments and aspirations within it [. . .] Ritual only comes alive experientially, emotionally, subjunctively, when actively read by audiences/readerships who are prepared to “participate” within it as symbolically meaningful to them, and who are prepared to accept the imagined solidarities on offer. (Cottle, 2006, p. 428)

This chapter has outlined some of the potential contributions of reception and ritual to our knowledge about media’s meanings in activist lives, both individually and collectively. In this discussion I have defined “ritual” in a somewhat loose manner, insomuch as everyday media consumption can be considered habitual and “ritualized” (Couldry, 2003). Some scholars have recommended defining ritualized media use as “a symbolic activity for participation in some larger order of meanings” and rigorously delimiting it as something exceptional, to be distinguished from mere “habits” and noninstrumental media use (Rothenbuhler, 1998, p. 83). The rational dimension of ritual hints that such acts of media consumption might also serve audience uses such as gaining pleasure, or they might provide social functions such as making connections; however, there is still much space for social reflexivity and critique beyond Durkheimian, neo-Marxist, or uses-and-gratifications theory (Cottle, 2006).

For the sake of simplicity, I have focused here mainly on the binary distinction of production–consumption, which risks obscuring the *circulation* of media among activist audiences. Discussions about so-called former audiences, which tend to mistakenly collapse the producer with the consumer, risk eliding the distinction between producing a new activist message and just distributing an existing one. For instance, screening an existing documentary to a new audience might be a significant act, but it is quite distinct from actually producing a brand-new activist film. Ditto forwarding friends or colleagues a link, via email, to a story published on an alternative-press website. Although circulation has received somewhat short thrift here, the concept has yielded constructive insights in my work on ritual, which reveals some of the social limitations of new media. A good illustration can be found in my research on zine producers, who circulated their printed creations by hand, in elaborate rituals of distribution. Those producers felt that print xerography offered a more gratifying and immediate way of making personal connections with their audiences and of building the zine community – where producers are also readers, and readers might become producers – than online publishing did. Material circulation by, to, and through audiences might likewise play an important role in building activist

communities, which share many participatory ideals, and perhaps rituals, with the zine community.

Research on activist audiences and interpretive communities that embraces ritual–transmission reflexivity could help explain how media consumption practices and preferences contribute to participation in democratic society writ large. Whereas people often assume that public disengagement and apathy are correlated with not paying attention to current events (see Couldry, Livingstone, & Markham, 2007), activists comprise an audience that's both engaged and attentive. As information overload grows and attention spans shrink in the digital age, a continued emphasis on activist media production, at the expense of consumption, is exceedingly troublesome. Somebody has to listen to the activist messages available in alternative media . . . and, presumably, to act as a result of having heard those messages. With access to the means of producing and circulating information now more widespread than ever, public attention itself might be the scarcest resource. After all, as Gitlin (1980) has compellingly demonstrated, the lesson of 1960s activism was not just that people were recording what happened, but that the whole world was watching it, too.

Audiences as Citizens

Insights from Three Decades of Reception Research

Kim Christian Schrøder

ABSTRACT

This chapter traces the insights about citizenship offered by audience reception research since its inception in the 1980s, through a theoretical and analytical portrait of five historical stages of reception research about mediated citizenship: (1) hegemonic citizenship; (2) monitorial citizenship; (3) popular citizenship; (4) participatory citizenship; and (5) ubiquitous citizenship. Maintaining a strong empirical commitment throughout, mostly to the findings of qualitative research, the chapter also reports substantially from recent and ongoing reception research into the ways in which the news media – and popular and entertainment media in a broader sense – may serve as resources for a political and cultural citizenship that is anchored in everyday life. The five stages of reception research, conceptualized as scientific paradigms, are modeled into a historical typology that synthesizes, for each historical stage, its aims, its theoretical foundation, the preferred methods, the key scholars, and the approximate year in which the paradigm became visible in the scholarly landscape.

The moment one starts to talk about citizenship, one is also inevitably talking about political rights, political and cultural power, and political and cultural identities. Citizenship in a democracy has to do with being and feeling like the member of a political entity such as a nation (Anderson, 1983), and with being able, to a greater

or lesser extent, to have a say in, and some power over, the running of the affairs of this political entity. In order to function as a citizen, one must have access to sufficient and relevant information about the circumstances – past, present, and future – facing the political entity, and one must have the right and the ability to participate in the public debates that precede political decisions. Finally, an individual must have formalized channels of exercising his or her power as a citizen, including – crucially – the ability to vote for the political representatives and leaders who exercise power on the basis of their being invested with the responsibility to ensure the citizens', or the people's, sovereignty.

In Western democracies, the media – along with other fundamental social institutions, such as the educational system – have played a pivotal role in facilitating the practice of citizenship for several centuries, by providing the democratic prerequisites for the citizenry. These prerequisites include supplying on a continuous basis the information that citizens need in order to monitor social affairs and facilitating a channel of public deliberation among the citizens, in order that they may cast their votes in an enlightened way in elections – which result in the formation of parliamentary bodies entrusted with the legislative process and the appointment of a political executive institution (government) (McNair, 2003). The media are thus the key guarantors of the democratically vital “public sphere” (Habermas, 1962), ideally a transparent informative and deliberative forum to which all citizens must have equal access.

A democratic society must have mechanisms for the continuous monitoring of the health of democratic processes, and – in addition to the media themselves – a range of academic disciplines have been entrusted with this task of monitoring. Communication and media research, alongside political science, cultural studies, sociology, economics, and other social and cultural scientific research traditions, has focused on the adequacy of relationships between (on the one hand) the institutions of the mass media, in their historically developing phases and their relative dependence on publicist and commercial motivations, and (on the other) the political institutions and processes – and especially on the possible consequences of the way in which the news media cover elections and affect their outcomes (see for instance Negrine, 1996, Strömbäck, 2008).

As a result of the division of labor within communication studies, reception research – a relatively young discipline, which has emerged around 1980 – has put the spotlight on what one could call the micro-processes of citizenship formation through the media, by considering, mainly through qualitative research methods, people's political meaning-making in their encounters with news formats in the context of everyday life. This chapter maps and critically examines the contributions of audience reception research to advancing our understanding of the ways in which the media have intervened in forging formations of citizenship for three decades.

While 30 years may seem a short period in the history of democracy, nevertheless this chapter argues that the three decades of reception research, while maintaining a generally shared perspective of *mediated meaning-making* on citizenship, can be seen as

a succession of five shifting lenses through which reception researchers have observed and interpreted the media/citizenship nexus. These shifting lenses have resulted from the changing agendas of political landscapes since the 1970s, from genre and program innovations of the media, and from the rapid development of digital and mobile media technologies that supplement and may even supplant the print and broadcasting media.

The five stages are each characterized by the dominance of one lens of perception, while previous lenses have continued to exist and to exert their influence even as new understandings have emerged and become dominant. The stages proposed and developed in the following pages are: (1) hegemonic citizenship; (2) monitorial citizenship; (3) popular citizenship; (4) participatory citizenship; and (5) ubiquitous citizenship.

If we lean unpretentiously on the notion of scholarly “paradigms” (Gitlin, 1978), we can say that a stage is a paradigmatic framework of understanding, which at a given point in time guides reception researchers concerned with mediated citizenship toward relevant and interesting objects of study, the appropriate methods for studying our research concerns, the expected findings, and the possible avenues for intervening in the observed practices.

Each stage will be characterized by a detailed presentation and discussion of one or two significant reception case studies, which illuminate the scholarly and political concerns of that stage. On the basis of these case studies, the distillation of a historical typology will then be attempted. The chapter will end with reflections on the theoretical and methodological visions that influence the paths currently taken by reception researchers into the contemporary and future landscapes of mediatized citizenship.

Reception Research: Delimiting the Scope of the Analysis

Following David Morley (1980) – who operationalized his mentor Stuart Hall’s theory of encoding and decoding (Hall, 1973) for his qualitative empirical reception study of the British current affairs program *Nationwide* (see below) – I define reception as the process through which “audiences differentially read and make sense of messages which have been transmitted, and act on those meanings within the context of the rest of their situation and experience” (Morley, 1980, p. 11). (For further definition of the field, see Jensen & Rosengren, 1990; Jensen, 1991; Schröder, Drotner, Kline, & Murray, 2003, ch. 8.)

Today the landscape of reception research is still dominated by qualitative methods, although this dominance has become less dogmatic than it was during the pioneering years. There is a consensus today among reception researchers that methodological pluralism is often the best way to obtain explanatory power (Schröder et al., 2003, ch. 17).

In the remainder of this chapter I shall map and critically examine the ways in which reception researchers have analyzed the media/citizenship nexus through five

related historical stages. It will not be possible to cover all the work within reception research that could be relevant for the understanding of mediated citizenship. This examination will limit its scope to empirical research that has focused on news rather than on entertainment media (although the latter will find their way into the account of Stage 3), and to research that has adopted a qualitative rather than a quantitative approach (although the latter will be considered from the moment it makes its appearance on the horizon of reception research in the mid-1990s; see Lewis, 1997). Mediated citizenship will be dealt with in a way that epitomizes its “political” as opposed to its “cultural” aspects – since the latter would have required the inclusion of reception insights about cultural and subcultural identities and about the gendered and ethnic dimensions of citizenship (see Radway, 1984; Ang, 1985; Liebes & Katz, 1990; Jhally & Lewis, 1992; Hermes, 1995) – all of which exceeds by far the space available here. The chapter does not define or discuss the notion of citizenship separately, as changing understandings of this concept will emerge from the outline and review of reception research over the five stages. Readers who are especially interested in going into political science-anchored discussions of citizenship in the context of media studies are referred to the extensive expositions in the work of scholars like Keane (1991), Livingstone and Lunt (1994), Schudson (1997), Dahlgren (2006), and Couldry, Livingstone, and Markham (2007).

Stage 1: Hegemonic Citizenship

The notion of citizenship dealt with under the description “hegemonic” is somewhat different from the notions of citizenship covered by the following four stages. For instance the term “citizen” is not used explicitly by the scholars whose work comes under this heading: Stuart Hall, David Morley, and John Fiske. However, these scholars are centrally concerned with questions of political power, political identity, and the formation of political consciousness in a class-divided democratic society, as they analyze through reception research how it is that those individuals and groups who have managed historically to appropriate power over society’s resources and social arrangements also succeed in holding on to this fundamental authority over the majority of citizens, whose lives are led outside the hierarchies of power.

It falls outside the scope of this chapter to provide even a shorthand version of the Marxist theory of capitalist society; but it has to be said that it was such a view that was pervasive in the intellectual climate of the 1970s in many parts of the humanities and social sciences, and this mindset dominated the first stage in reception research. At the time many political activists inside and outside of academia hoped to be able to mobilize the people – or the citizens – for the cause of large-scale political emancipation, through radical or reformist political action.

As a prerequisite to such liberating political action, the pioneers of reception research wanted to map the landscape of political consciousness formed by the mass

media and to illuminate the balance between the forces of oppression and those of emancipation in the informative genres of news and current affairs programs (Hall, 1973; Morley, 1980), as well as in the entertainment genres of television serials and popular novels (Fiske, 1987; Radway, 1984). Here we shall concentrate on the reception perspectives of Hall and Morley, whose work engaged the realm of politics directly by tackling its representations in news and current affairs programming. The work of John Fiske used the same theoretical framework and was highly contested because of its celebration of the semiotic oppositional powers of the subordinate classes (Fiske, 1987). Fiske coined the phrase “semiotic democracy” to explain how ordinary people had the freedom to decode media discourses in a manner that was at least symbolically oppositional to the hegemonic powers.

The seminal reception research inaugurated theoretically by Hall (1973) and substantiated empirically by Morley (1980) in his qualitative study of the BBC current affairs program *Nationwide* followed after both authors had conducted extensive textual analyses of mass media content. These critiques of media representations demonstrated the massive scale of the ideological hegemony propagated on behalf of the allegedly oppressive social arrangements that victimized the working classes while seemingly providing an affluent society with increasing standards of living and with consumer goods (Hall, Clarke, Critcher, Jefferson, & Roberts, 1978). The crucial question for reception researchers in this sort of situation was: How do audiences make sense of such a partisan consensual picture of societal issues and problems? How do they position themselves ideologically in relation to the ideological position offered by the *Nationwide* current affairs program? The reception interviews designed to provide answers to these questions were analyzed according to a template that assumed that the program offered viewers an ideologically loaded “preferred meaning,” to which they could relate through a “dominant,” “negotiated,” or “oppositional” reading.

This matrix has since become part of the terminological heritage of reception research, along with the notion of polysemy (multiple meanings). Morley sees the TV program as “a structured polysemy. [. . .] [I]t has been structured in dominance, although its meaning can never be totally fixed or ‘closed’” (Morley, 1980, p. 10).

From this definition of the preferred meaning it follows that it is somehow easier for viewers to swallow the preferred reading, which is the meaning that, so to speak, offers itself to viewers as the *dominant* reading; viewers actualize the dominant, hegemonic reading when they share the codes in which the program was encoded and the accompanying system of values, beliefs, and assumptions about the social world. When viewers share the program’s code in part and accept the preferred meaning broadly, but modify it in accordance with their own interests and preferences, they produce a *negotiated* reading. *Oppositional* readings occur when viewers do not share at all the codes that generated the program but draw on an alternative, politically critical and oppositional frame of interpretation.

Toward the end of the book Morley briefly relates his reception findings to more conventional forms of citizen behavior, such as party political affiliations and

preferences in parliamentary elections. However, he is careful to emphasize that there is no simple coupling of each of the three reading positions and party political affiliations. Among the groups that take up a particular reading position we may find a variety of party political outlooks and a variety of objective class affiliations. At the end of the day, therefore, Morley's findings do not enable him to discern fixed and predictable patterns in the mediated social production of hegemony and resistance among citizens.

Stage 2: Monitorial Citizenship

Without abandoning the theoretical understanding of how a capitalist society reproduces its social formation through the ideological discourses of the mass media, which characterized Stage 1, at Stage 2 reception research explores news reception mainly from the perspective of how the news enables citizens to *monitor* their social environment, which is relevant for their ability to function as political subjects in a representative democracy.¹ Inspired by James Lull's pioneering ethnographic study of "the social uses of television" (1980), Klaus Bruhn Jensen (1986; 1990) wishes to draw a descriptive map on the basis of informants' accounts of their uses of TV news in everyday life. The theoretical framework governing the study is remarkably similar to the Hall–Morley conceptualization of political hegemony, which is largely assumed to be the study's analytical premise. Jensen agrees with John Fiske that the polysemic potential of the news text leads to differentiated readings, which can be seen as semiotically "oppositional" in the sense of diverging from the ideologically dominant "preferred" reading inscribed into the news message. But Jensen disputes Fiske's assertion that oppositional readings are in themselves politically significant – semiotic resistance is not political resistance (Jensen, 1990, p. 58).

Jensen's analytical mapping of the everyday uses and readings of TV news shows that the real political potency of news reception is negligible. Casting the news program both as an "account" of the mechanisms of representative democracy and as a "resource" that audiences may potentially utilize in forms of political participation, Jensen bases his study on 24 individual qualitative interviews with US male respondents to a screening of yesterday's mainstream news program.

Echoing Lull (1980), Jensen distinguishes four different "uses" of TV news. Unlike Morley, he finds his informants' readings to be closely associated with the everyday situational context in which these informants watch the news programs:

- 1 *Contextual uses* have to do with the way news programs are watched as a flow and "punctuate daily life," often in the family environment and intersecting with gender roles and other power relations.
- 2 *Informational uses* occur when the news is watched for the "factual knowledge of political issues and events" that it brings to viewers, who find this knowledge

relevant “in their roles as consumer, employee, and, above all, as citizen and voter” (Jensen, 1990, p. 66). Here viewers follow the daily news as a way to maintain a modest level of political information between elections and to be able to engage in trivial conversation with other people. The news is not used for genuine political deliberation in the Habermasian sense associated with active citizenship in the public sphere.

- 3 *Legitimizing uses* occur when citizens are maintaining their political self-image by routinely following the news and deluding themselves that they are not too remote from the ideal of active citizenship. The ordinary news user is politically compliant. However, disgruntled semiotic opposition from the safety and comfort of one’s armchair is widely practised.
- 4 *Diversional uses* have to do with perceiving the news as a kind of (political) entertainment that serves to “divert the attention of the audience, not just from boredom and anxiety, but from major issues of social conflict and power” (p. 71). Diversion may arise from two characteristics of TV news: first, from the parasocial appeal and charisma of the anchor people; second, from the visual experience of immediacy, human interest, narrative drama, liveliness, and so on.

Jensen thus sees TV news as a public forum (Newcomb & Hirsch, 1983) that enables citizens to monitor their society routinely, on a daily basis, but in a hegemonic manner that has few or no repercussions on the nation’s political scene, a far cry from the active citizens conceptualized in Habermas’ theory of the public sphere.

Asking what can be done to remedy this sad state of affairs, Jensen argues that apparently the sheer availability of politically informative news programs is not sufficient to ensure a politically enlightened and active citizenry, not even in the case of well-educated social groups, the representatives of which were no more active politically than their low-educated counterparts. For Jensen, the answer lies in a deliberate effort on the part of the educational system to teach media literacy: “Since the political process is increasingly conducted through the mass media, popular participation depends on a new functional literacy comprising critical comprehension skills as well as concrete production skills” (p. 74).

This educational perspective on mediated citizenship is shared by Justin Lewis (1991), but his studies of news reception processes led him to look for the solution in a different direction, namely that of the producers of journalistic content: they ought to compose their news stories in alternative ways, which would hold greater appeal, ensure better comprehension, and build more useful insights into political affairs among the citizens. Lewis’ news reception study analyses 50 viewers’ understanding of the British Independent Television (ITV) news program *News at Ten*, in order to map the way TV news enables citizens to monitor their world by bringing to them the prerequisites of competent citizenship: “TV news is at the core of any modern democratic system. The quality of the decisions we make within a democracy depends upon the quality of the information we receive” (Lewis, 1991, p. 123).

The findings “suggest that TV news performs, even on its own terms, quite dismally” (p. 152). This assessment is due to the fact that the TV news offered by the news journalists is neither comprehensible nor meaningful to most ordinary people. The gist of Lewis’ argument is that TV news is not enough like fictional narratives: these have a tripartite structure – enigma, suspension, resolution – that catches and holds the viewer’s attention and paves the way for the process of comprehension. The news, by contrast, “is a form that, by abandoning narrative, abandons substantial sections of the viewer’s consciousness” (p. 129). The typical TV news story is inherently demotivating, because it takes a story and “squeezes the sense of mystery right out of it. [. . .] It is like being told the punchline before the joke” (pp. 130–131).

For Lewis, the solution to the miscommunication uncovered through reception analysis lies in the opportunity this provides for journalists to educate citizens, because, “if news adopted the conventions of narrative codes used in other cultural forms, it would be considerably more successful at communicating its message to people” (p. 138). This conclusion is slightly at odds with the findings of Goddard, Corner, Gavin, and Richardson (1998), who studied citizens’ understanding of televised economic news that used personalizing narrative devices in order to make the often abstract economic news easier to understand. The personalizing devices did serve to increase the informants’ understanding of the individual news story, but they did not seem to lead to a deeper understanding of the more abstract economic mechanisms of the national economy.

Stage 3: Popular Citizenship

While the reception research of Stage 1 and Stage 2 considered the ways in which sedentary viewers situated in their living-rooms made sense of television genres, the pioneering study by Livingstone and Lunt (1994) explored a novel and different program format, which gave access to the voices of audience members: the latter were invited into the TV studio to participate in debate programs. Such studio audience discussion programs were new at the time in a European broadcasting context; they resulted in part from the widespread deregulation and commercialization of television under the right-wing governments of the 1980s. Yet some specimens of participatory formats had existed in the US since the 1970s, notably the format-establishing *Phil Donahue Show*; this program format also surged in the US from the late 1980s on (e.g., *The Oprah Winfrey Show*).

In the classic form studied by Livingstone and Lunt, British programs like *The Kilroy Show*, *The Time the Place*, and *Donahue* invited lay people, experts, and politicians into a TV amphitheater studio in order to debate topical and controversial issues, which people usually have opinions about and which may trigger talk and debate. The fundamental concern, empirically explored by Livingstone and Lunt, was whether such programs, often considered as a low-culture genre by cultural critics, could be said to

have any democratic value. The answer hinges on whether the audiences that watch them regularly can be demonstrated to acquire significant prerequisites of citizenship precisely through the experience of watching such programs:

Is any purpose served by these discussions or are they simply entertainment programmes designed to fill the schedules? [. . .] Is this a new form of public space or forum, part of a media public sphere? [. . .] Does “real conversation” take place in these discussions and does this produce a community of citizens talking among themselves about issues of public concern? (Livingstone & Lunt, 1994, p. 1)

The yardstick held up by Livingstone and Lunt to measure the democratic quality of audience debate programs is clearly indebted to Habermas’ definition of the public sphere in its ideal form. However, granting that public debate must adhere to agreed rules of rational argument, Livingstone and Lunt do not require these programs to result in the achievement of consensual conclusions that reach beyond the program and into the circles of political power. Instead, following the theory of media as a “cultural forum” (Newcomb & Hirsch, 1984), Livingstone and Lunt describe Habermas’ requirement as “too stringent [. . .] for the present-day mass media cultural forum, which may more simply place arguments side by side without analysis or integration” (1994, p. 31). They argue that the value of the less than ideal public sphere of debate programs lies in their multivocal contribution (1) to a shared “contemporary version of common sense” (*ibid.*), which sets normative standards for human behavior; and (2) to the formation of people’s political and cultural identities at individual and group levels.

The methodological framework for Livingstone and Lunt’s project was comprehensive and consisted of multiple methods, which included focus groups, individual in-depth interviews, and, as an early example within reception research, the cross-fertilization of qualitative and quantitative methods. Livingstone, Wober, and Lunt (1994) supplemented the qualitative sense-making fieldwork with a representative survey of 500 respondents. Audience members were found to be very appreciative of the program’s admission of diverse voices as a basis for democratic debate. In addition to this plurality of voices, the existence of a genuine public sphere also depends on the perceived equality of these voices: everyone – both people in authoritative positions, such as politicians or scientific experts, and members of the lay citizenry – enters the debate on equal terms. Apparently the programs were successful in creating this levelling of voices:

Experts? [. . .] I think that people who Kilroy [the host] thinks are going to act as experts don’t always turn out that way. You often get much more useful information from the ordinary person in the studio who happens to be very good at communicating and has some significant things to say. (George, viewer, quoted in Livingstone & Lunt, 1994, p. 100)

Livingstone and Lunt also emphasize the overall evaluative and discriminating stance that audiences adopt toward these programs. Far from merely engaging in debate

programs for their titillating or sensational aspects, audience members deployed argumentative and evaluative aesthetic frameworks of interpretation to position themselves as public citizens rather than private consumers (see also Schröder & Phillips, 2005).

These results are on the whole corroborated by the findings of the survey study concerning the extent to which these qualitative findings can be generalized to the population of the UK. The survey confirms “the viewers’ skepticism about the authority of experts, their sense of involvement in the genre, their cautious acceptance of the genre as a putative mass mediated public sphere, and their interest in hearing the voices of ordinary experience” (Livingstone, Wober, & Lunt, 1994, p. 355). Remarkably perhaps, these responses were almost universal across demographic groups, only age being a distinguishing variable in a few respects: older viewers were more critical of the chaotic nature of the debates and more respectful of the experts. Interestingly, it turned out that the more one likes the program, the more one tends to see it as an authentically mediated public sphere, while those who do not find the program democratically enriching may nevertheless watch it in order to ridicule those who go on the show (p. 374).

In their concluding discussion of studio debate programs, Livingstone and Lunt situate them between the polar opposites of media content catering for “the public knowledge project” and media content catering for “the popular culture project” (Corner, 1991, p. 268). They stress that the traditional division between informative and entertaining genres on the one hand and the corresponding audience categories of “critical insight” and “mindless pleasure” on the other is not applicable to audience discussion programs: “Audience discussion programs do not fit into this opposition of information and entertainment” (Livingstone & Lunt, 1994, p. 179).

Other reception scholars have taken up the gauntlet of exploring the claim that popular entertainment, in its pure form, is inevitably detrimental to democratic endeavors. Pioneering this perspective, Liesbet van Zoonen (2005) presents an argument for the compatibility between entertainment and politics and against their separation, which in her view would only serve to aggravate the decline in political engagement; this is because in our modern culture, whether we like it or not (Postman, 1985), entertainment looms large in citizens’ everyday lives. Van Zoonen’s work is thus designed as an intervention with “an agenda to think about entertaining politics, instead of simply discarding it as irrelevant and dangerous to citizenship and the democratic project” (2005, p. viii; see also Curran, 2010).

Focusing her empirical work on fan culture as an intense form of audiencehood, Van Zoonen argues that “the behavior of fans in relation to soaps, popular music, and other entertainment genres is not fundamentally different from what is required of citizens” (2005, p. 16). Following performers and politicians respectively, “both fans and citizens follow their objects intensely, promote them to outsiders, deliberate among each other, come to informed judgments, and propose alternatives” (ibid.). And both kinds of relationship incorporate affective and emotional, cognitive and rational engagements. One should therefore acknowledge “the rational in fandom and the emotional in politics” (p. 17).

Van Zoonen also analyzes audience reception of films and TV series whose story lines include subject matter from the world of politics. Methodologically she does not base her analysis on empirical fieldwork that uses interview encounters with audience members, but on a fly-on-the-wall netnography. She observes discussion groups on Internet Movie Database, looking for answers to the question “whether and how entertaining politics enables people to perform as citizens” (p. 123). She concludes that the movies and TV series discussed by the groups

enable people to think about the dilemmas that politicians and politics face (reflection), criticize or praise politicians for their morals and stories for their ideology (judgment), and express their hopes and ideals (utopia). [. . .] [Thus] popular culture does indeed function as a source of gaining insight in politics and as a means to perform citizenship by presenting one’s ideas in a public setting. (p. 137)

Therefore, instead of denigrating the political potential of popular entertainment, educators should be alert to its political potential, because the fictional personalization and narrativization of politics “may offer a way into politics for people otherwise excluded or bored” (p. 150). Such findings are complemented by Johansson’s reception study of 55 readers of British tabloid newspapers (Johansson, 2009).

Stage 4: Participatory Citizenship

We now live in a convergence culture – a world in which, as Henry Jenkins puts it, “old and new media collide” (Jenkins, 2006). In the 1990s, when the Internet was still seen as a “new” medium, it was greeted with a mixture of utopian and dystopian visions: while the pessimists focused on its massive potential for surveillance and control of the remotest corner of human life, the optimists welcomed the Internet as a technology that would revolutionize all areas of cultural life, leading toward a new participatory public sphere in the realm of politics and innovating the world of education through new collaborative and creative ways of learning. Practices of “collective intelligence” and “collective creativity” would break down traditional divisions between the public and the private, mass and interpersonal communication, information and entertainment, production and consumption, and audience roles would hybridize into those of “produser” (Bruns, 2005) or “prosumer” (Toffler, 1980).

Today user-generated content (UGC) is actively solicited by news institutions, and the open publishing sites have developed into giant content-sharing fora and into a blogosphere. Some of the citizen interventions found here are extending the boundaries of democracy, because they are voicing alternatives and critical points of view that are more radical than those of consensual mainstream politics and that can therefore be seen as “oppositional” – not just *interpretatively* (as at Stage 1 above, when reception researchers were analyzing “oppositional” and hegemonic citizenship), but

interventionally: the alternative voices often originate in “a preoccupation with the global issues around which contemporary identity is shaped: globalization itself; the environment; protection of endangered species; human rights and free speech” (Ross & Nightingale, 2003, p. 153).

While political communication research has overwhelmingly focused on the role of the media in elections, Torpe’s (2006) study of online citizens explores whether the Internet adds something to the deliberative processes of local municipalities during a period of normal political activity between elections. Setting out to explore empirically how the Internet can be seen to enable deliberative practices or not, Torpe defines “public deliberation” as “non-coercive forms of arguments circulating between transmitters and receivers in open spaces based on mutual expectations of being listened to and receiving some sort of response,” where “consensus is a possibility, not a necessity or a normative ideal” (Torpe, 2006, p. 36). He also investigates whether the Internet can work in parallel with the traditional media in these respects and whether it adds new democratic affordances for citizens.

Torpe’s empirical study is a holistic one, in which he investigates Internet usage and experiences in three local communities in Denmark. He concludes cautiously that the Internet does have some potential for increasing citizens’ interest in participating in deliberations about local affairs, but that potential should not be exaggerated. Little “indicates that the net has replaced other sources of information or that new groups of people are included in the information activities (p. 39).

With respect to agenda-setting and deliberative functions, however, the net has had a moderately vitalizing effect on municipal democracy. While online participants tend to resemble those who are also active offline,

the open character of online debate forums may generally favour persons with low educational skills. Furthermore, it may be easier for many persons to post letters on an online discussion forum than to take the floor at a public meeting. [. . .] All in all the case reveals that an online discussion forum can serve as an alternative channel for raising issues that – for some reason or another – are ignored in the traditional media. (Torpe, 2006, p. 41)

Taking these issues to a new sphere – that of young people using the Internet for purposes of civic participation – Banaji, Buckingham, van Zoonen, and Hirzalla (2009) arrive at quite similar conclusions, drawing on reception analysis and other methods: while the Internet can be a valuable tool for young people who are already engaged in political or civic activity, the use of networked technologies is “not inherently democratic, nor does it automatically have democratic consequences” (p. 4). Another finding is that, in order to be successful in engaging young people, online provision should be linked to offline activities and to “related concerns and issues that young people are experiencing in their everyday lives” (ibid.). Moreover, the more these issues spring from young people’s local community or from aspects of identity politics, the more they are likely to engage young people in communicative and deliberative activities.

More in the fashion of classic reception studies, Wahl-Jørgensen, Williams, and Wardle (2010) analyze audience perceptions of user-generated content (UGC) in the news media. They are driven by a desire to explore whether the user-generated content enabled by digital communication technologies is transforming journalism in democratizing and egalitarian ways. On the whole, their findings confirm what has been found by other researchers (see Örnebring, 2008): UGC is no panacea for contemporary journalism, which tends to domesticate the participatory formats in accordance with commercial imperatives and professional norms. As a window on the audience's sense-making practices of UGC, Wahl-Jørgensen and her team interviewed 12 focus groups with a total of 100 people recruited to represent the key demographics of class, age, gender, and levels of activism. The group discussions were organized around different types of UGC: eye-witness accounts, online interaction, text messages and emails, and radio phone-ins.

Audiences were found to distinguish clearly between *content UGC* and *comment UGC*: generally informants are very positive toward content UGC, which includes audience footage, audience experiences, and audience stories and is perceived to be immediate, fresh coverage collected before the arrival of professional news teams. These forms of UGC add drama and emotion, are more authentic, and are seen to be a real democratization of news production (Wahl-Jørgensen et al., 2010, pp. 181–182). The researchers relate this preference for perspectives not produced by journalists (the professional experts of news reporting) to the findings of Livingstone and Lunt (1994), whose living-room audiences of television debate programs also found the contributions of lay participants to be more valuable than those of political and academic experts. Such populist “valorisation of the voices of ‘ordinary people’” appears to indicate that, “in contemporary public debate, the authority of the ‘deep personal’ experience trumps that of specialized professional or political knowledge of the facts” (Wahl-Jørgensen et al., 2010, p. 184).

In contrast, audience “comment,” which includes opinions offered by individuals in radio phone-ins or have-your-say debates on the Internet, is viewed less favorably, because the motivations of those contributing are viewed with suspicion: lay commentators are seen as “uninformed and inarticulate; publicity seekers looking for their five minutes of fame; holding extreme and often unpalatable views; and/or bored, lonely people with too much time on their hands” (ibid., p. 185). From a democratic perspective, it thus seems that the more UGC is offered by audience members as active citizens seeking to make a contribution to democratic deliberation, the less it is valued by news consuming audiences: “The self-interest associated with public participation undermines the value of the contribution, insofar as it does not appear to be motivated by concerns about the common good, but instead is squarely focused on displaying individual opinions (ibid., p. 186).

Equally dishearteningly, Wahl-Jørgensen and colleagues find that what keeps those who do care about the common good away from contributing to the citizen fora of the mediatized public sphere is the inconsequentiality of such contributions. As one informant phrases it:

RICHARD: Whatever I write in about the budget isn't going to change what our money gets spent on, is it? [. . .] If I knew that my information was going to go to the House of Commons [. . .], then I can see the point of commenting. But when you just comment, and just put your opinion into a computer like that there's no point. (Ibid., p. 187)

This sense of powerlessness experienced by citizens also looms large in the findings of Couldry and colleagues' (2007) large-scale mapping of public engagement with the media.

It would seem that, with such democratic despondency, we have reached an impasse for deliberative democracy on a mass scale:

the lack of interest in, and respect for, audience comment raises worrying questions about the much-heralded potential of new participatory genres, such as UGC, to enhance citizen participation and ties in with larger concerns about the place of political engagement in an anti-political culture. (Wahl-Jørgensen et al., 2010, p. 190)

On the one hand, it is clear that a citizen's desire to speak emerges from the belief that somewhere someone is listening and that, if the arguments offered are relevant and weighty, that someone will act appropriately. On the other hand, it is equally clear that there is no way this kind of universal communicative consequentiality can be operationalized in decision-making political units such as nations, regions, or even municipalities. It would therefore seem that, for most citizens in democratic societies, the rewards of communicative engagement with the media in public debates, in traditional and more participatory media, will have to come from involvement in local communities and from immersion in the political issues that individuals find to be personally worthwhile. Some of these community activities and their attention to issues, though local and small-scale, will have participatory ramifications beyond the national boundaries, emerging eventually in the contexts of supranational and global public spheres.

Cammaerts (2008) offers an extensive review of the participatory potentials of Web 2.0 (which he terms the "blogosphere"), in all the contradictory diversity of its coexisting emancipatory and oppressive potentials and its parallels with mainstream and oppositional discourses. His conclusions suggest the need to adopt both a sobering corrective to the utopian visions of the democratic potential of the social Internet and a theoretical invitation, based on the work of Chantal Mouffe (1999; see Carpentier & Cammaerts, 2006), to move beyond the Habermassian ideal of "the" public sphere:

The image of the blogosphere as a deliberative space, as a model for an online (Habermassian) public sphere where every person is free to air his or her views, thus making rational dialogue between equal status-free participants in public debates possible, is somewhat problematic to say the least. [. . .] The image of [. . .] antagonistic public spaces (Mouffe, 1999) which are inherently conflictual [. . .] is more relevant to make sense of the online environment than the Habermassian consensual public sphere, implied by the notion blogosphere. (Cammaerts, 2008, pp. 373–374)

Stage 5: Ubiquitous Citizenship

For more than a decade, political and cultural theorists, including scholars with a key interest in media studies, have been attempting to re-theorize the notion of the public sphere in the direction of what they call cultural citizenship and civic agency (Turner, 2001; Dahlgren, 2006; Couldry, 2006). Their theoretical work draws on the extensive debates about Habermas' theory of the public sphere that have been going on since the translation of his 1962 German book into English in 1989 (Calhoun, 1992). While subscribing to the idea of a myriad of partisan "micro" public spheres feeding into the consensual Habermasian "macro" public sphere (Fraser, 1992; Garnham, 1992), or to Keane's vision of "complex mosaics of differently sized, overlapping and connected public spheres" (Keane, 1999), they also seek to redefine legitimate politics as something that cannot and should not be confined spatially to a sacred political sphere characterized by formal political institutions, but that is fundamentally anchored in people's everyday realities (Livingstone, 2005). Moreover, echoing the scholars of Stage 3 (popular citizenship), cultural citizenship also confronts the conceptions of citizenship that reify rationality and impartiality, arguing that political engagement is often a product of passionate feeling (Wahl-Jørgensen, 2006).

Dahlgren and Olsson's (2009) study of young citizens' enactment of mediated civic agency analyzes the "civic culture" concept of democratic engagement, previously developed by Dahlgren (2009). Through qualitative interviews in Sweden, the authors offer "concrete examples of how, specifically, the internet has been shaped into a resource for young, politically active people's concrete everyday practices of pursuing their political interests" (Dahlgren & Olsson, 2009, p. 209). Civic agency thus has to do with "the subjective side of citizenship," with how "one can see oneself as a citizen," and with "a sense of belonging to – and perceived possibilities for participating in – societal development" (*ibid.*, p. 200). The sample of informants is deliberately biased in favor of young people (16–19-year-olds) who are affiliated to political parties of youth organizations and various alternative activist movements.

Dahlgren and Olsson's interviews demonstrate that the Internet is an important resource for these informants' knowledge repertoires – for obtaining a regular overview of "the news," for seeking information from first-hand sources about what goes on under the surface of the political landscape, and for acquiring alternative or non-mainstream information. By participating in online debates in political fora, the informants are socialized to observe democratic values and procedures such as equality, solidarity, openness, reciprocity, tolerance, and so on and they learn adherence to the common good by engaging with other debaters, with whom they disagree, not as if the latter were "enemies," but by approaching them as rational and legitimate "adversaries."

The interviews also show that the young citizens are taking full advantage of the digital opportunities for activating collective intelligence and creativity, for instance by contributing to an "adbusters" website, where activists may collaborate about parodying unethical or sexist commercials (for digital content creation in the "mash-up

culture,” see Löwgren, 2010). As this study shows, some kinds of reception research that are carried out from the civic culture perspective, while declaring their interest to be in the performance of “citizenship in everyday life,” continue to adhere to a Habermassian normative notion of citizenship, according to which a certain level of engagement and activity in “real” politics is required in order for citizenship to count as legitimate. By implication, an individual who is not active in political organizations or in public debates tends to be left out of the investigation. Such a notion of civic culture is not really anchored in a multifarious, “not-so-political” everyday life.

However, another strand of contemporary thinking about media and citizenship incorporates the everyday perspective of citizenship into its theoretical agenda in a manner that breaks more radically with the Habermassian heritage, wishing to map and assess mediated citizenship in practices that are not just embryonic stages of “real” politics but are firmly lodged in the realm of the everyday and often are not perceived as political at all by individuals (that is, at a subjective level). Suggesting that citizenship today is “ubiquitous,” Jeffrey Jones argues that “we engage politics everywhere, all the time, and the media are central to that engagement” (2006, p. 9). Here citizenship is taken all the way to incorporate a celebration of the dormant political potential of people’s informal conversations in daily life:

The looseness, open-endedness of everyday talk, its creativity, potential for empathy and affective elements are indispensable for the vitality of democratic politics. [. . .] all forms of talk are of potential relevance for civic discussion, politics can materialize even in unexpected contexts of daily conversation. [. . .] Formal deliberative democracy is too restrictive as an ideal; it banishes by definition that speech which may be on its way towards politics, speech which originates in the disjointed settings of everyday life and yet manages to join together experience and information, wisdom and reflection in ways that may lead to question, contestation, political conflict. (Dahlgren, 2006, p. 279)²

Kevin Barnhurst (2003) explicitly denounces the Habermassian ideal of citizenship as he tries to develop a new ideal of citizenship as a yardstick for evaluating ordinary people’s political activity. According to Barnhurst, the Habermassian ideal of citizenship “sets up an unreachable ideal that devalues how people enact citizenship in daily life” (Barnhurst, 2003, p. 134), and “requires levels of commitment to political activity that amount to more than full-time work” (p. 137). On the basis of a qualitative life-story approach to citizenship, Barnhurst argues that political communication research should perceive politics as something that, for most people, “becomes intentional only in sporadic flashes” (p. 133).

With this growing awareness of the need to redirect the focus of political communication research toward the everyday micro-dynamics of democracy, reception research tends to adopt a theoretical agnosticism about what is democratically valuable and what is not. It is argued that the inconspicuous practices of daily life can be seen as the site of identities and passions from which people can sometimes – *if the occasion arises*, so to speak – be launched into the public sphere (Wahl-Jørgensen, 2006).

The empirical work of Irene Costera Meijer on the everyday news consumption and reception of young people in the Netherlands can be seen as congenial to this rejuvenated version of public sphere theory (Meijer, 2007). First, Meijer finds that, for many young informants, the distinction between information and entertainment is not operative. Thus fiction genres are said to be “informative” because they sustain emotional intelligence and thus provide an understanding of how something feels.

Second, Meijer finds that the informative function of media is becoming secondary to their communicative function in social networks, in other words the way news enables young people to join in the small talk of peer group networks. News reception research, therefore, should look not only for the “learning outcomes” of news consumption (as do Curran, Lund, Iyengar, & Salovaara-Moring, 2009 and Pew Research Center, 2008), but for the way news exposure contributes to “mediated public connection” (Couldry et al., 2007).

Third, Meijer refutes the accusations of superficiality directed at the young generation, which are sometimes heard from cultural critics. Even when young people are merely grazing the news media, they are not necessarily being superficial; they try to avoid missing anything important. And, while the “snacking” approach is the one they often adopt, they also go for the full meal once in a while – and therefore (while they are critical of traditional news formats) they nevertheless want “the news” to remain the way it is! News is sacrosanct.

In another empirical study based on the notion of cultural citizenship, Cornel Sandvoss argues that discourses around the consumption of sports do not mark the further decline of a free and rational public; rather such discourses can sometimes constitute “an alternative public sphere in which significant cultural, social, and political issues, which are neglected or insufficiently addressed in the official channels of parliamentary democracies, are negotiated and reflected upon” (Sandvoss, 2009, p. 60). The study consists of reception interviews with soccer fans and of a netnographic examination of the Internet conversations of fans of the German soccer club Bayer Leverkusen about non-white players in the team and about other fans’ racist abuse toward them. The analysis of these responses documents that sport holds immense political potential: the fan discourses incorporate exchanges about nationalism, ethnicity, religion, gender, and other issues of political significance.

In a wider sense, these findings can be seen as evidence that politics and citizenship are indeed being acted out everywhere, as part of a ubiquitous civic agency. Following Hartley (1999), Sandvoss argues that today the mass media *are* the public sphere, instead of merely being a sadly deficient *vehicle* of such a sphere, and that simply by virtue of being a member of the media audience the individual is a politically inscribed citizen.

Audiences as Citizens: A Historical Typology

The five stages of reception research on media-influenced citizenship presented and discussed above can be put together, in tabular form, into a historical typology, which

encapsulates in strongly reductionist fashion the key characteristics of the successive lenses through which reception researchers have observed, analyzed, and explained how the media influence the democratic prerequisites and practices of citizens and how citizens draw on the media as resources for democratic understanding and action (see Table 23.1).

For each stage, the typology lists the analytical and political aims of those working under the paradigm in question, the main theorists, the primary methodological approach, a handful of key researchers applying the perspective, and the approximate year in which the paradigm emerged. It should be stressed, of course, that the boundaries between the stages should be seen as porous and that previous stages (except Stage 1) continue without rupture, coexisting with emerging ones.

Ubiquitous Citizenship: Challenges for Reception Research

If politics and citizenship are everywhere, they should be explored everywhere. And, to the extent that they are intertwined with the media – which is a fundamental condition of life in mediatized societies (Strömbäck, 2008; Hjarvard, 2008; Livingstone, 2009) – reception research should explore them across the total ensemble of media.

Moreover, we should direct our empirical interest toward the ways in which the media – traditional and digital – function as everyday routine resources for what we might call “dormant citizenship” – how the media may, “subliminally” as it were, in an everyday, non-conspicuous process, help build the forms of civic knowledge, the communicative literacies, and the aesthetic repertoires that are the prerequisites for making the transition from latency to agency and from dormant to vigilant citizenship if and when the occasion arises in the life history of an individual.

In order for this to happen, it is necessary to adopt a radical user’s perspective, which means that we have to explore from the individual’s point of view how his or her particular constellation of media – routinely, subconsciously, and consciously selected from the ensemble of media – is subjectively perceived and makes sense in that individual’s life. Metaphorically speaking, we must ask people to tell us what – when they shop in the media-as-supermarket – they take from the shelves and put into their shopping carts, and why. This may involve reception researchers in empirical designs that extend the boundaries of reception research in the direction of audience ethnography, along the lines of Marie Gillespie’s study of the everyday TV talk of diasporic youth cultures in London. Her talk about news among Punjabi teenagers led to “explicit consideration of the themes of citizenship, class and ‘race,’ and religious, cultural and national difference and identity” (Gillespie, 1995, p. 26). Her study alerts us to the fact that, in many respects, the “political” significance of civic agency derives from practices belonging in the arena of everyday culture and of the creative expression of hybrid identities (see also the anthropological studies of news audiences in Bird, 2010, Part 2).

Table 23.1 Five historical stages of audiences as citizens, as seen by reception research

	Aim of research	Theory	Method	Scholars	Heyday
<i>Hegemonic citizenship</i>	Radical social change	Marx Gramsci, Parkin	Qualitative	Hall, 1973 Morley, 1980 Fiske, 1987	1973–1990
<i>Monitorial citizenship</i>	Democratic empowerment	Gramsci Habermas	Qualitative	Jensen, 1986 Lewis, 1991 Hagen, 1994	1985–
<i>Popular citizenship</i>	Public deliberation, political literacy	Habermas Fraser	Qualitative (+ quantitative)	Goddard et al., 1998 Livingstone and Lunt, 1994 Norris, 2000 Van Zoonen, 2005	1990–
<i>Participatory citizenship</i>	Deliberation Participation	Habermas Castells Mouffe Fraser	Qualitative (+ quantitative)	Jenkins, 2006 Carpentier, 2003 Cammaerts, 2008 Wahl-Jørgensen et al., 2010	2000–
<i>Ubiquitous citizenship</i>	Civic agency	Habermas Dahlgren	Qualitative Quantitative	Couldry et al., 2007 Meijer, 2007 Dahlgren, 2009	2005–

To label this radical, ideologically oriented kind of reception research in a way that aligns it with succeeding reformist approaches could be seen as a retrospective reinterpretation, or even as a retrospective imposition. The justification for doing so is that the reception research of the first stage does explore the ideological sense-making of what these scholars clearly saw as politically inscribed subjects.

Also, we should direct our attention to the online media sphere for a glimpse of people's spontaneous discussions of urgent social and cultural issues. Studying the two reality TV programs *Big Brother* and *Wife Swap* as a trigger for everyday political talk in the discussion forums connected to the programs, Graham and Hajru find that, in such discussions,

everyday political talk is not meaningless because it does not typically lead to direct political action. On the contrary, it is through participation in everyday talk whereby [sic] citizens become aware and informed, try to understand others, test old and new ideas, and express, develop and transform their preferences and opinions. (Graham & Hajru, 2011, p. 20; cf. Sandvoss, 2009)

Pursuing related micro-agency objectives, the reception study about cross-media news consumption that is currently carried out by the author of this chapter (see Schrøder & Steeg Larsen, 2010; Schrøder & Kobbarnagel, 2010) adopts a qualitative approach intended to discover, at ground level, the cross-media news packages (or constellations) appropriated by citizen-consumers from the news market supply. In principle, everyday citizenship emerges from engagement with all kinds of media, and any limitation of the scope of this project to news media is done solely for pragmatic reasons, to prevent the risk of wanting to study everything and ending up studying nothing. At the end of the project, we want to be able to discern the similarities and differences between the contents of the informants' news-shopping carts, to discover reliable and valid patterns or types of news media use with democratic implications.

It is a premise of our analysis that people's choice of news media is determined by what news media they perceive to be *worthwhile* – because the particular constellation they put together on a daily and weekly basis has established itself as one that cumulatively satisfies their conscious and unconscious needs for information about what goes on in their world. People only use the news media that they experience as delivering some kind of pay-off. There must be some metaphorical “interest” resulting from the “investment” they make in their portfolio of news media.

This has to do, above all else, with people's experience of the relevance of the news media's news and views, comments and columns, cartoons and comics, and the rest. The crucial factor in the experience of content relevance is the news media's capacity to enable “public connection.” A heuristic concept invented by Couldry and colleagues, public connection is defined as a shared

orientation to a public world where matters of shared concern are, or at least should be, addressed: [. . .] [P]ublic connection is principally sustained by a convergence in the media people consume. [. . .] “[P]ublic connection” represents our attempt to capture one key empirical precondition of democratic engagement in a way that does not privilege in advance any particular definition of politics. (Couldry et al., 2007, pp. 3–5)

In accordance with what was said above about the need to modernize and broaden the Habermasian notion of civic agency, we use public connection in a broader sense, to denote people's need to equip themselves both for the role of citizen-member of the democratic order, through mediatized information about public affairs, and for the role of belonging as a community member in the broadest possible everyday sense.³

Weaving public connections entails relying on media resources in order to participate in social and cultural networks of all kinds in everyday life; being able to navigate adequately as a spouse, parent, neighbor, colleague, consumer, and simply human being in late modern life; being able to communicate sensibly with significant others in one's close networks, as well as with more distant others in relevant commercial and institutional contexts. Public connection, in our use of the term, thus includes both what we might call "everyday public connection" and "political public connection." To illuminate the transitions among these two is the main challenge for reception researchers who wish to understand media citizenship.

NOTES

- 1 The concept of monitorial citizenship used here was coined independently of Schudson's (1998) characterization of citizens who engage in information-gathering and processing in the era of abundance of mediated information in the last decades of the twentieth century (Schudson, 1998). I use "monitorial citizenship" more commonsensically, to denote a citizen who relies routinely on the news media in order to form a working impression of his social environment.
- 2 The two strands of innovative thinking about civic agency outlined here sometimes coexist in the work of one scholar, although their political visions are quite different. For example, I draw on different writings by Dahlgren to illuminate the two strands.
- 3 A related effort to understand "how individuals and groups form democratic selves, or identities, and under what conditions of life" can be found in the work of Lewis A. Friedland (Friedland, 2001, p. 359). Using quantitative methods, this work represents an ambitious attempt to theorize and investigate into how societies cohere, focusing on the ecology of media communication at the local community level, while the citizens' sense-making of the media is not a central concern.

Citizenship, Communication, and Modes of Audience Engagement

Exploring Alternative Voices in the Public Sphere

Christine L. Garlough and Dhavan V. Shah

ABSTRACT

This chapter explores how citizens in Western and Eastern democracies are transforming communication messages and modalities to provoke audiences to engage in public life. These individuals are using a range of communication strategies and systems, some ancient and others nascent, to add their own voices and their constituents' voices to the public sphere. Reflecting on this orientation, we begin by considering how street theater is used throughout the world as a form of political rhetoric and as a venue for the creation of spaces where audiences may participate in thoughtful discussion. We focus on the use of theater by marginalized groups, as a medium for speaking about social injustices. We then consider how documentary film has been deployed across a range of countries as a tool in struggles for recognition and acknowledgment. Both "outsider" and mainstream efforts are explored, as sites for community building and maintenance. We end by examining how digital media are used in advanced societies as a means of populating the marketplace of ideas. Here we focus on how the Internet is used both as a source of information and as a sphere for audience interaction. In all of these cases, citizens are transforming the features and the form of media messages and modes, in an effort to incite their target audiences' interest and shape political outcomes and public policies.

Citizens involved in grassroots politics often engage in acts of witnessing and in testimonials about their life experiences as a way to participate in the public sphere. They present themselves in this way across a diverse set of communication modalities – from interpersonal and low-tech modes (conversation, street theater) to mass-produced and high-tech forms (documentaries, websites) – in order to share their perspectives on controversial issues. In this chapter we consider three such approaches to citizen communication and activism: street theater, documentary film, and political blogging. Regardless of the mode, the goal of these “acts of acknowledgement” is to draw audiences into this process through highly personal public performances – accounts of issues that entertain and inform – and to invite audiences to engage in turn with these questions and concerns, in meaningful ways (Schaffer & Smith, 2004, p. 16). Through performances of such communicative acts, citizens are attempting to engage with others, build community, and argue for political points of view.

According to Shuman (2005), the success of these autobiographical communications, which are intended not only to involve, but also to activate the audience depends on two judgments delivered by the people who encounter them: (1) the teller’s *experience* is understood as “real”, as something that actually happened; and (2) the *teller* is seen as entitled to claim the experience as his/her own. Such autobiographical accounts differ markedly from episodic frames and cues found within news coverage – that is, packaging press accounts around individuals and instances – that have been found to reduce the sense of shared responsibility (Iyengar, 1991) and to crystallize intolerance (Cho, Zuniga, Shah, & McLeod, 2006). Instead, these forms of witnessing and testimony highlight relationality (our lived connection to other human beings) and help to build community by drawing audience members into a process of actively acknowledging the perspective and experience of the teller.

Reflecting upon this orientation, we begin by considering how street theater is used throughout the world as a form of political rhetoric and as a venue for the creation of spaces for thoughtful discussion. We focus on its use by marginalized groups in India to speak about social injustices – specifically, what is called “sex-selection abortion” (selective abortion, where the selection is based on the predicted sex of the newborn) as a form of female infanticide. We then consider how documentary film has been deployed in a diasporic context as a tool in struggles for recognition and acknowledgment and as a site of community building and maintenance. Our focus centers on the documentary efforts of a grassroots organization to address issues of post-9/11 hate crimes directed at South Asian and Arab Americans. We conclude by considering the role of political blogs, videos, and other user-generated content in providing sites of (1) interaction with like-minded others; (2) confirmation of social perceptions; and (3) coordination for participatory action.

In all of these cases, citizens are transforming the features and the forms of messages as well as the modes in which messages are delivered, in an effort to shape political outcomes and public policies. Whether using street theater, documentary film, or digital media, audiences are seen as active parts in the communication process, telling their own stories and speaking back to expressive actors. It is through

these forms that alternative perspectives get communicated across conventional ideological or structural boundaries. Although distinct in many ways, these forms of autobiographical, narrative, and public testimonial provide channels for people to engage effectively with major public issues.

Political Street Plays

Street play performances take place all around the world, from the courtyards of South Asia to the town halls of America. They are a form of grassroots politics in which ordinary people put the aesthetics of verbal and non-verbal performance to work in the service of resistance. As Katrak (2009, p. 244) notes:

In this contemporary climate of social injustice and violence, I believe that the creative worker (artist and activist) plays a special role – through the tools of writing and performance, visual and expressive forms of music and dance – in representing political realities and in raising social awareness that can inspire social change.

This form is also used to communicate with audiences that might not otherwise get the message, due to limited access to communication technologies – whether print, broadcast, or digital. For this reason, street theater is often used as a political tool to express alternative perspectives on major social issues.

This observation is borne out by scholars from a variety of disciplines. Schechner (2003) writes about street theater performances in Shanghai in May 1989 that called for the resignation of Li Peng and for the retirement of Deng Xiaoping. Haedicke's work (2009) describes disenfranchised groups using performance to protest against unethical immigration practices. Garlough (2007) has explored how South Asian feminists use street plays to address issues of "dowry death" (the death of young wives as a result of in-laws' attempts to increase their dowry), caste, and sex-selection abortion. To illustrate our perspective on the role of street theater as a mode of introducing alternative perspectives into the public sphere, we consider the example of South Asian women's groups and their deployment of this cultural form.

South Asian women's organizations have labored to address the social inequality and everyday struggles faced by women in India since the early twentieth century. Growing out of movements for Indian independence, early activists tended to address "women's issues" in terms defined by nationalist reformers. In contrast, current work by women's organizations represents a varied array of political positions, ranging from radical feminist to Hindu fundamentalist (Kumar, 1993). These groups strive for social reform and legislative changes regarding issues such as rape, inheritance rights, domestic abuse, dowry death, and prenatal sex determination tests (Garlough, 2008a, 2008b).

In order to promote awareness about social conditions that require immediate attention, feminists in India participate in a variety of resistive activities. Some organizations

focus upon economic advancement or educational programs, whereas others attempt to raise women's self-awareness of gender disparities, or to increase political participation. Many organize protest rallies, run for office, lobby for special interests, and work within communities to tackle long-term goals concerning education and skills attainment. Our concern, however, centers on how grassroots feminist groups deploy street plays as part of political outreach campaigns. Many of these efforts embed performances within personal testimony, merging autobiography with familiar cultural forms such as songs, folklore, dance, and artwork. For these women, the combination of personal narratives with cultural forms yields a rhetorical resource for advancing political arguments, raising critical consciousness, and mobilizing groups of women.

Cultural Action and Street Theater

This use of culture for political purposes, labeled "cultural action" by many South Asian feminists, reflects a particular pragmatism. Some contend that traditional cultural forms and performances, typically associated with conservative norms and values, could be powerfully appropriated for subversive political purposes. These traditional practices hold political potential because they are an immediately recognizable means by which to engage and involve disenfranchised groups of women in civic issues that impact their everyday lives. Indeed, all cultural forms – popular culture, high culture, and folk culture – are viewed as potential *resources* in mobilizing grassroots political action.

So how can cultural forms be successfully transformed into compelling political tools? The reasons behind street theater's success are varied. In some cases, it is related to the iconic social importance of the form. In other cases, success stems from the form's ability to create ties to other audience members, to demarcate community boundaries, or to encourage self-reflection and national identity formation (Schechner, 2003). Often it involves including individuals who are socially disenfranchised (Boal, 1979; Kumar, 1993). Of course, the success of any given effort depends, at least in part, upon the target audience's familiarity with the particular cultural form that is used. As Zipes (1983) notes, the success of critically appropriating and transfiguring a cultural form depends on the audience's recognition of strategic changes in the typical format and content of that form. The uncanny experience of familiarity combined with unfamiliarity provokes critical inquiry.

This perspective draws attention to the fact that even traditional cultural forms can be successfully appropriated for the purpose of addressing contemporary issues from a critical perspective. Indian street theater's heritage stems from long-standing traditions of folk performance, classical drama, and Western theater that have been combined with "the political pamphlet, the wall poster, the agitational speech, the political demonstration – these all have gone into creating the diverse forms adopted by our street theatre" (Hashmi, 1988, p. 31). Akin to Boal's (1979) *Theater of the*

Oppressed, Indian street theater is a means through which individuals and groups can explore oppositional meanings and suggest new orientations for social action. These oral performances offer strategies of self-representation, used at particular times, in particular places, and in front of particular audiences (Bauman, 1986). In this sense, street plays are a twentieth-century phenomenon, often connected to a scene of protest linked to left-wing politics.

Indeed, to characterize such performances as mere entertainment certainly denies their power. Like other types of political performance, street theater creates an alternative space where civic struggles for social justice can take place (Clair, Chapman, & Kunkel, 1996; Madison & Hamera, 2006; Pollock, 2005). In addition to providing entertainment, it often offers the audience an opportunity for shared understanding and a chance to reflect upon how the personal narratives of others can resonate within a broader set of community concerns. However, unlike other dramatic forms, modern street theater is *principally* characterized by political, often militant, overtones. The range of groups that use street plays to discuss complex issues in an engaging, often colloquial fashion includes religious reformers, politicians, citizen groups, factory workers, and students. Yet the principal practitioners are middle-class urban activists who believe that their privilege requires them to bear responsibility for the less fortunate (Kumar, 1993).

As Garlough (2007, 2008a, 2008b, 2009) notes, due to the fact that street plays are essentially a mobile medium, actors can go out in search of an audience. This mobility means that often no formal stage exists, and props are kept to a minimum. Costumes, particularly masks, sometimes create a bit of illusion; however, the emphasis falls most heavily upon the performance of the actors. On the written page, prior to the performance, the structure of street plays resembles that of other literary dramatic pieces; however, in practice, the form remains somewhat open to the demands of the moment, and this often enhances the political potential of the event. For instance, during performance, audience members might publicly interact with the lines spoken on stage by shouting out a response, which may prompt further unscripted remarks from the actors. This provides an opportunity for both actors and audience members to contribute to a political exchange in a public space – a situation that is often unavailable to many disenfranchised individuals. In addition, sometimes a question-and-answer session follows the performance, allowing for deeper interactions between performers and audience members as they further interrogate the problems at hand.

Scripts often develop from small-group discussions within local organizations. In this context, women identify a particular problem that women in their community face and offer personal testimony regarding their experiences with the issue. Within their testimonies, common concerns often include the caste system, communalism, healthcare, political corruption, terrorism, current economic trends, alcoholism, sexism, or police brutality. Many times the authors explicitly reference these testimonies in the scripts; indeed, many activists feel that contextualizing issues through testimonies is the key to engaging the audience and successfully communicating their

agendas. In addition, popular film tunes, folk songs and dances, as well as characters from popular literature or media are frequently included in the scripts, not only to provide entertainment, but also to serve as touchstones or comparison points. The stage is a place where cultural possibilities are explored, performed, and suggested, with the hope of broader impact. These performances are also central to the politics of remembering and forgetting. They keep the trauma visible, they testify to the suffering of others, and they engage in the rhetorical work of witnessing that involves listening, deliberating, and exploring possibilities.

Sahiyar's Street Play

An excellent example of this type of grassroots feminist activism can be found in the street plays written and produced by the women of Sahiyar (see Garlough, 2009). Sahiyar is one of over four hundred women's organizations in the state of Gujarat. It is one of the first of its kind in the modern city of Vadodara (formerly Baroda). Sahiyar's approach to activism is decidedly radical, unlike that of more conventional women's organizations. Rather than focusing upon trade skills or literacy, they promote critical awareness of women's social oppression; that is their fundamental goal. This work addresses pressing needs of the women in their community, needs that arise due to the rise of rape, domestic violence, dowry harassment, and the use of sex-determination tests in recent years.

A relatively small organization, Sahiyar includes in its staff only part-time volunteers and a staff director, all of whom are women. The size of Sahiyar limits the types of activities it can sponsor. Its priorities include organizing demonstrations, social reform, counseling for "family affairs" and "personal problems," work with Dalit and Muslim women who struggle against communalism and casteism, and the publication of a feminist magazine called *Narimukti*, produced in collaboration with other feminist organizations. Recently, the group created a workshop to study Maharashtra's pioneering Anti-Sex Determination Act, with the hope of having a similar law passed in Gujarat.

Growing out of this project, the groups wrote and performed a street play called *Deekri chhu, manav chhu . . . manvtane marsho shu?* (*I am your daughter, I am a human being . . . will you kill humanity?*). As Garlough (2009) explains in an article titled "Feminist Street Performance and Grassroots Advocacy in India: Combating Sex-Selection Abortion," their mission was to increase awareness of the connection between the identification of fetuses as female and subsequent abortions. It is estimated that one half of a million female fetuses are aborted in India in a year simply because of their gender; so there are 10 million fewer female births than would have occurred without this practice (Jha, Kumar, Vasa, Dhingra, Thiruchelvan, & Moineddin, 2006). Many feminist groups have identified it as yet another form of violence against women – a mode of gendercide or eugenics. For Sahiyar, the issue of sex-selection abortion was one of ethics, and their street performance was a call to activate the individual and social conscience.

"I am your daughter, I am a human being . . . will you kill humanity?" was written in a feminist workshop with Krishna Nandi and other students in the Women's Studies program at Maharaja Sayajirao University of Baroda. The plot developed primarily from personal testimonies, case studies, and a sex-selection abortion survey that the women of Sahiyar had conducted in Vadodara and that encompassed a broad range of religions, classes, and castes. The women who agreed to participate in this street play performance were not professional actors; indeed, most of them had never acted before. Yet they participated because, as Daksha Patel explained to me in a fieldwork interview, "the issue is of critical importance to the lives and freedoms of women." Moreover, the testimonies given by women about the often-traumatic events leading to sex-selection abortions and the scope of the problem – 500,000 girls eradicated a year – instilled feelings of responsibility.

The performed scenes grew directly from interviews with women in the Vadodara area; they give a sense of the struggles and misfortunes that women experienced in their homes, neighborhoods, and hospitals; and they offer a counternarrative grounded in a postcolonial feminist politics of recognition (Garlough, 2009). Consequently the scenes not only focus upon the personal problems experienced by women faced with the possibility of being subjected to a sex-selection abortion, they also refute three common public arguments that support the practices of sex determination and sex-selection abortion: (1) girls are simply a drain on the economic resources of families; (2) sex-selection abortions are primarily a practice of illiterate, rural Hindus; and (3) women are generally un-coerced in their decision to have sex-selection abortions. This set of claims is advanced delicately, as the group also wants to make clear that they support a woman's right to abortion. The two issues, they argue, should not be conflated.

Audiences ranging from middle-class Hindus in temple courtyards to college students in university auditoriums to citizens at political rallies have witnessed this street play over a three-year period, with audience members also participating in the question-and-answer session that follows it. It is a powerful illustration of the ways in which individuals can use street play performance to keep a trauma visible, to testify to the suffering of others, and to engage in the political work of challenging social practices that are harmful to women. Most importantly, the performance of this autobiographical counternarrative in public offers an opening for political speech – a creation that is personal, interpersonal, and social. These street plays are not the only autobiographical form of mass communication that have been put to use by activists seeking to add their voice to the public sphere.

Activist Documentaries

For the past century, around the globe, non-fiction film has played a prominent role in the public sphere, providing a powerful means of persuasion that seeks to facilitate

deliberation and debate, constitute identities, and raise political consciousness. This can be observed in a range of contexts, from the 1930s Worker's Film and Photo League to the radical documentaries produced by South Asian feminists in the 1990s (Aguayo, 2005). Unfortunately most film studies scholars' academic discussions about documentaries fail to put the kind of theory that grows from the subfields of political communication or rhetoric at the center of their investigations (Holbert, Kwak, & Shah, 2003).

On the other hand, it is only quite recently that political communication scholars or rhetoric scholars have become interested in studying activist documentary films, learning how to promote the interests of social movements and how to perform social tasks by presenting a complex assemblage of discourse, image, and sound (Dow, 2004). Among the most valuable explorations of this intersection is Plantinga's (1997) work, which provides a rhetorical orientation to understanding non-fiction film.

Certainly there are many types of non-fiction films or documentaries that would hold the interest of those concerned with political or rhetorical discourse. Of particular interest, however, is the activist documentary. What makes a film an activist documentary? Some scholars argue that the defining element has to do with the intentions of the filmmaker, or with his or her ideological commitments outside of filmmaking. Others claim that it is a reflection of the political or moral content of the film. Still others believe that, to be considered an activist documentary, the film must intervene in the public sphere and create political agents who take up the political work initiated by documentary film. Nevertheless, scholars seem to be in agreement that the influence of activist documentary is primarily constitutive, providing a sense of shared identification and purpose (Blakesley, 2003; Dow, 2004).

Testimony, Recognition, and Acknowledgment

One of the central issues taken up by scholars concerned with testimony and witnessing is a critique of the epistemological nature of documentary film. Historically, both producers and audiences of non-fiction film have understood it to provide truthful and factual representations of the world. In consequence, the camera was compared to an eye that captured the world in action and accurately recorded it. Therefore documentary films were conceived of as a powerful witness of the veracity of particular human experiences – they stockpiled facts. However, in recent years most scholars have challenged this sense of objectivity and highlighted the constructive nature both of the recording and of the editing process, as well as the interpretative nature of the viewing experience (Plantinga, 1997). As a result, many scholars of non-fiction film have focused upon the attempts of various directors to play with traditional elements of documentary film in order to move the audience, from a passive viewing experience in which they uncritically accept the veracity of what is being presented to them, to a more active and reflexive viewing experience, which democratizes the interpretation of non-fiction content.

In relation to this, some scholars have been interested in the ways recognition and acknowledgment grow out of witnessing documentary films (Garlough, 2009). In particular, this perspective is concerned with how representations of suffering may move us to action. How might they renew our sense of collective responsibility for the lives of others, especially those whom we view as foreigners? Does our personal experience of traumatic narratives encourage acts of identification, or does it merely illuminate our encounters in a voyeuristic fashion? Questions about the nature of these representations also lead to a concern with the limits of understanding and recognition and with the potential of such shifts in consciousness to lead to concrete action.

These questions suggest something beyond a sense of “mere” acknowledgment, in which something or someone is only given notice in passing. Rather, they foreground a more substantive sense of acknowledgment, one that opens both space and time for others, allows for honest, critical discussion, and is therefore intimately tied to the prospect of protest rather than being opposed to it. As Michael Hyde argues in *The Life-Giving Gift of Acknowledgment*:

Acknowledgment is a moral act, it functions to transform space and time, to *create* openings wherein people can dwell, deliberate, and know together what is right, good, just, and truthful. Acknowledgment thereby grants people *hope*, the opportunity for [a] new beginning, a second chance, whereby they might improve their lot in life. (Hyde, 2006)

In this way acknowledgment has a political potential. It functions rhetorically, to give attention to others, thereby allowing people to share their concerns as well as to express the truth about their sense of their own existence.

SAALT's Documentary

An important example of the ways activist documentaries may engage in the public sphere as sites of testimony, witnessing, and acknowledgment is *Raising Our Voices*, a documentary made by South Asian Americans Leading Together (SAALT). SAALT, based in Washington, DC, is a national non-profit organization whose aim is “to address political, social justice, and quality-of-life issues facing South Asian Americans, especially the disadvantaged and marginalized segments of the community.” It seeks to create an environment in which South Asians can participate and influence US public life, documentary film being just one of the tools it uses (SAALT, 2002).

SAALT works to accomplish its goals through advocacy, community education, local capacity building, leadership development, partnerships with other disempowered communities, and collaboration with broader civil and immigration rights movements. It has also formed partnerships with several other national coalitions in order to raise awareness of issues facing the South Asian community around immigration and hate crimes.

Raising Our Voices is one such effort. It addresses the rise of hate crimes against South Asian Americans in the last four decades, and it was initially completed just days before the tragic events of 9/11. Immediately following the attack – as a plethora of media images and stories directed our attention toward a devastated lower Manhattan and Pentagon, bodies of victims, the testimony of witnesses, and the grief of those who lost loved ones – hate crimes against South Asian Americans soared (Lavina, 2008).¹ Across the United States, individuals vilified as “terrorists” were beaten with baseball bats, attacked in their places of work and worship, violated verbally with racial epithets, and frightened by death threats. Not surprisingly, given the “rally around the flag” phenomenon that characterized mainstream discourse in the wake of 9/11, these forms of suffering were not prevalent in the public sphere and generally went unacknowledged by the wider US population, even by many South Asian Americans. But SAALT cataloged these hate crimes in the aftermath of 9/11 and collected testimonies from many of the victims, some for use in a modified version of the documentary and others for inclusion in an online archive.

The revised documentary was first screened in New York, barely three months after the terrorist attacks, and it provided an important framework for understanding and visualizing the impact of the post-9/11 backlash that affected so many South Asians in America. As SAALT Director Deepa Iyer noted:

The one really important thing to keep in mind is the sense of urgency. And the urgency came not from a self-imposed deadline but our complete understanding that there was so much going on in our community in terms of the backlash that this documentary needed to come out because it would make a difference. And it would be a tool and it would be for people to use to try and prevent some of the backlash from happening (SAALT, 2002).

She went on to explain that the documentary was intended to play a role in generating dialogue, understanding, even controversy. Propelled by the positive responses that the documentary received, SAALT launched a national hate crimes awareness campaign in 2002. Along with the documentary, SAALT compiled a companion guide designed to facilitate discussion of the issues surrounding the film. The guide contains background information on hate crimes, demographic information on the South Asian community, and ideas on how to incorporate the video into workshops. It also contains two separate sections – one intended for college students and the other for community leaders – with discussion questions and examples of the types of activities that community members could undertake, such as the creation of a local task force to monitor hate crimes, or the provision of interpreters in local police departments to help translate procedures and rights for victims with limited English proficiency.

Since then, the documentary has been screened in more than 150 venues. In May 2007, for example, it was shown at the University of Michigan’s first annual Hate Crime Week, which was taking place along with the Martin Luther King symposium. Many in the audience expressed concern about the ongoing discrimination directed

at South Asians. For instance one audience member stated: “I didn’t even know about half of the issues the documentary presented. It’s very shocking to see. I’m actually surprised to see that so many Indians are victims (of hate crimes). I thought (the backlash) was more of an Arab thing” (see Khatri & Doctoroff, 2002). This is a consistent response. As Iyer remarks:

People’s reactions to the film range depending on what point in time they were watching it [*sic*] and what they’re bringing to it. Most of the reactions are “I never knew this was a problem,” or “Such a severe problem in the community,” or “I’m so glad that this documentary exists because now everyone can see that these sorts of incidences are happening to our community.” There have been a lot of people who have broken down and cried. There are people usually after the film shown, there is a lot of silence for about 5–7 minutes because people are digesting and processing it. We give people that time but we don’t actually say, “what’s your feedback?” we actually let people process it before we go back . . . We ask questions: What about this documentary surprised you? What was new to you? That really sparks discussion (SAALT, 2002).

Her comments reflect how valuable the biographical narratives contained in the documentary have been in helping South Asians become more aware of the extent of the prejudice faced by other members of their community, encouraging as they did acknowledgment of the relational nature of such suffering. But more generally, the film is valuable because it contests a homogeneous understanding of US identity and encourages awareness of the broader need for US citizens to accept immigrants and diasporic persons. In addition, *Raising Our Voices* addresses the pressure to stay silent and, by allowing victims of hate crimes to share their stories, it shows a way also to address experiences of social violence, thus creating a context for acknowledging the marginalization of South Asian Americans and the disruption of their “homes.”

Digital Engagement

Although street plays have been used for centuries to entertain and illustrate social issues and documentary film has been put to work over the last several decades to catalog and comment on politics, the Internet and the advent of digital and social media platforms have provided a decidedly newer venue for engagement. Some trace back this development to the use of the Internet by the Zapatista movement over 20 years ago; as Kahn and Kellner (2004, p. 87) write,

the early adoption and successful use of the Internet in the early 1990s by the indigenous EZLN Zapatista movement in the Chiapas region of Mexico quickly dramatized how new media and grass roots progressivism might synergize, excite the world, and challenge status quo culture and politics.

With the rapid diffusion of the Internet as well as the increasing use of and reliance on this medium as a political venue, evidence of the Internet as a force in shaping engagement and activism has grown. A turning point in the use of the Internet for activism was the rise of the antiwar movement:

In late 2002 and early 2003, global anti-war movements began to emerge as significant challenges to Bush administration policies against Iraq and the growing threat of conflict. Reaching out to broad audiences, political groups such as MoveOn (<http://www.moveon.org>), ANSWER (<http://www.internationalanswer.org>), and the United for Peace & Justice (<http://www.unitedforpeace.org>) used the internet to circulate anti-war information, organize demonstrations, and promote a wide diversity of anti-war activities. (Kahn & Kellner, 2004, p. 88)

In the years that have followed, a growing body of work has supported the perspective that the informational and expressive features of the Internet support collective action (Shah, Cho, Eveland, & Kwak, 2005; Shah et al., 2007). This body of work, which emphasizes the centrality of communication among citizens with a view to making political action possible, focuses on traditional modes of public-spirited participation, ignoring political protest participation and more radical forms of direct action.

Yet there is increasing attention being paid to the role of digital media in providing a means for political activists to insert alternative perspectives into the public sphere (Gueorguieva, 2008; Nah, Veenstra, & Shah, 2006; Thorson, Ekdale, Borah, Namkoong, & Shah, 2010). These scholarly inquiries consider how many emergent digital and social media are used for political purposes, from political blogs to online video. In many cases these online messages have an autobiographical component, weblogs often beginning as personal diaries and video posts often featuring a monologue to the camera and first-person accounts of events and experiences (Thorson et al., 2010).

For example, Thorson and colleagues' analysis of the 2008 passage of California's Proposition 8, which effectively banned same-sex marriage, found that most posted videos advocating for or against "Prop 8" were original content, often autobiographical, with a majority against Proposition 8. Most of the "No on 8" videos were amateur productions that functioned as a means of witnessing. In this sense,

witnessing is traditionally a strategy of the oppressed or powerless, as they are the ones most likely to fear being forgotten by the dominant population. The production quality of these videos varies considerably as what is captured is more significant than how it is captured. (Thorson et al., 2010, p. 180)

Of course, the act of witnessing also has an effect on the audiences that encounter the video; for, as McHale (2004) states, "when people watch videos, viewers feel as if they are witnesses, rather than just consumers of someone else's account" (p. 156). The same sense of outrage and disbelief that characterized the Prop 8 protest videos was also a feature of the antiwar blogs, which were a point of focus of the protests against the War in Iraq and the supposed weapons of mass destruction (WMDs).

The Gulf War and Media Dissociation

The role played by these political blogs offers a case study illustrative of the use of digital media for activism. Work on Internet activism around the Gulf War investigates how news consumption and political exchanges among visitors to antiwar weblogs may have influenced political participation (Nah et al., 2006). On the basis of a survey of Internet users recruited through online channels critical of the Iraq War, the research finds that these respondents used the Internet in ways that encouraged antiwar activism, especially when they talked about politics online.

Illuminating further the autobiographical nature of these activist communications, related research has found that the process of explaining how political blog use produces involvement in antiwar protests was highly personal, and it was linked to the social construction of reality presented in the mass media to justify the war. Contrary to the view that news media exert social control over dissenters by discouraging political expression and opposition during periods when the public is being encouraged to “rally around the flag” (Mueller, 1970), these scholars found that Internet access allows people to play a more active role in their selection of media. This reduces the influence of the mainstream media and increases the likelihood of dissenters speaking out and taking action (Hwang, Schmierbach, Paek, Zuniga, & Shah, 2006).

Specifically, Hwang and colleagues find that people who are alienated from mainstream media engage in information gathering and discussion via the Internet. The more the individuals surveyed felt that their views differed from mainstream media portrayals, the more motivated they were to use the Internet as a source of information and as a conduit for discussion. These very same online behaviors, then, facilitated antiwar political action. As Glasberg and Shannon (2011, p. 56) write, “the more immersed [these activists] become in the Internet, the more dissociated they become from mainstream media,” which, in turn, leads them to challenge the official narrative and resist political authority (also Bennett, Wells, & Rank, 2009).

Proposition 8 and YouTube

This ability to challenge official viewpoints and to organize forms of resistance to governmental action must be understood in its interplay with key institutions and public policy. As the case of the War in Iraq illustrates, digital media use can serve as a counterpoint to traditional mainstream media, providing a corrective to what is perceived as a media reality that is inconsistent with what an individual believes to be true. However, the goal of digital activists would often seem to rest on the hope that their efforts have the ability to sway key institutional players and to reshape public policy. The use of YouTube as a platform for political commentary and activism in relation to California’s Prop 8 provides a vivid example of the potential for this dynamic.

The work of Sayre, Bode, Shah, Wilcox, and Shah (2010) considers whether the witnessing that takes place on sites like YouTube can spur coverage in conventional news outlets. As Vaidyanathan (2008) notes,

the power to control the message is no longer in the hands of the political parties and candidates or the mainstream media. It's now shared by the public at large. They can distribute a piece of media on YouTube faster in a 15-minute news cycle than traditional media can in a 24-hour news cycle.

This potential agenda-setting role for social media cuts both ways, of course, since it's also possible that the traditional media have set the agenda for the public, encouraging its members to post their results on sites such as YouTube. The research of Sayre and colleagues considers both possibilities.

Accordingly, their inquiry considers whether people who post content on YouTube are acting in response to mainstream news, possibly in reaction to perceived distortions in that coverage, or whether videos generated by citizens have the potency to actually shape news coverage of an issue, leading the agenda setting process. This work builds on the view that the witnessing and deliberation present in YouTube videos and in the user comments they elicit provide a potential forum for a digital public sphere that could rival other such venues (Downey & Fenton, 2003; Milliken & O'Donnell, 2008; Silverstone, 2001). As Sayre and colleagues (2010, pp. 14–15) contend, “minority opinions in particular are likely to take advantage of alternative media in order to make their voices heard.”

Notably, all these researchers find that newspaper coverage, search traffic, and YouTube postings are mutually determined by public events (e.g., elections, court decisions); but, once this is taken into account, a connection emerges between YouTube and the news media – one that shifts depending on the period in question. Before the election, mainstream media appeared to drive YouTube activity, much of the latter being produced as a corrective. However, after the election and the passage of Prop 8, YouTube videos appeared to drive the news coverage and the search traffic. That is, attention to Prop 8 on YouTube followed the mainstream media coverage before the November 4 election, but, when mainstream media coverage declined, citizens and activists began using YouTube as a platform, to register their opinions that they felt were underrepresented in the mainstream; and the media followed. These citizens' autobiographical accounts, whether a monologue to the camera or a first-person account of an event, proved to be potent forms of speech, garnering attention from the news media.

Witnessing as Engagement

Each of these case studies highlights a particular type of political discourse; they are testimonies (or the performance of personal experience stories) used by grassroots

groups to address exigencies in the public sphere. Certainly, stories and their persuasive appeals are part of our everyday practices – so much so that often we are hardly aware of them. As Kirsten Langellier notes: “In everyday talk, we tell stories or personal narratives, about our experiences of the mundane happenings of an ordinary day and the extraordinary events that mark our lives” (Langellier, 1989, p. 243). Personal experience stories or testimonies also play a significant role in the public sphere within more formalized or heightened accounts, which address issues of social importance. While some stories may work to maintain the status quo or rationalize oppression, especially when framed in episodic terms (Iyengar, 1991), others may offer oppositional readings and counter-histories that respond to calls of conscience, acknowledge the suffering of self and others, and have emancipatory potential (Adorno, 1991; Felman & Laub, 1992; Hyde, 2006; Pollock, 2005). More fundamentally, these biographical accounts, presented publicly through street plays, documentaries, and other modalities, are forms of political engagement around controversial and challenging issues.

Rich examples of this type of communication range from the testimonies of the Mothers of the Plaza de Mayo, who witness the disappearance of their children during the Dirty War in Argentina (1976–1983), to online grassroots forums such as YouTube, which were used by supporters and opponents of California’s Proposition 8, in the months before and after the controversial vote about defining marriage as an act between a man and women (Thorson et al., 2010). As Thorson and her team argue, these modes of communication turn audiences into witnesses rather than letting them just be passive consumers of an account of “others.” Because they do this, they can be used to “build community among like-minded others, reveal suffering to those geographically distant and, in some instances, serve as legal evidence of human rights abuses” (Thorson et al., 2010, p. 5).

Through these testimonies and the audience members’ act of witnessing them, conversations can occur about cultural differences and rights to self-determination (Schaffer & Smith, 2004, p. 16). These stories may also lead to a nuanced consideration of the communal, one that explores the challenges of living together. Furthermore, activists and members of grassroots movements use personal narrative to testify about forms of terror and trauma – including sexual violence, domestic abuse, political degradation, racism, terrorism, and genocide. Within tribunals and national investigations of human rights offenses, personal witnessing may play a key role in the creation of new rights protections (ibid.). These rhetorical discourses also create the possibility of address and acknowledgment from a listening community.

As noted above, Shuman (Shuman, 2005) suggests that the success of testimonies of suffering depend upon two factors. First, the *experience* that is at the center of the narrative is understood as real – something that truly happened. Second, the stories depend upon the authentication of identity claims – that is, on evidence that the teller is entitled to claim the experience as his/her own. In this way experience is presented as the most authentic kind of truth: the “real” experience of an “authentic” speaker.

Yet we know that autobiographical testimonials are never a “complete” account, as they are based upon fragments of memory that represent a particularly situated perspective (Felman & Laub, 1992). They are performed, an act of face-work driven by a desire for dignity and consistency in self-presentation (Goffman, 1963). Given this nature of autobiographical testimonials, the “truth” in personal experience stories is negotiated and subject to contested interpretations (Butler, 2005; Cavarero, 1997). As Smith (1998, p. 17) writes,

Every day in disparate venues, in response to sundry occasions, in front of precise audiences (even if an audience of one) people assemble, if only temporarily, a “life” to which they assign narrative coherence and meaning and through which they position themselves in historically specific identities. Whatever that occasion or that audience, the autobiographical speaker becomes a performative subject.

Both in the case of the street theater and in that of the documentary, which have been considered here, there are certainly aspects of performance and self-presentation. But this doesn’t detract from the fact that these two are forms of testimony and witnessing and that, as modes of engagement, they are at the center of much grassroots politics. These “acts of acknowledgment” draw audiences into interaction around an issue by simultaneously entertaining and informing them. The audiences, in turn, engage with these issues, participate in dialogues, and ultimately build a community. Their demands for acknowledgment – whether in the form of performing a street play, directing a documentary film, or developing a social media platform – highlight the bonds forged among members of a community and help create bridges to other groups.

NOTE

- 1 Partha Banerjee, community organizer of New Immigrant Community Empowerment (NICE): “There are many more hate crimes, particularly against South Asians, Muslims and Arabs after 9/11 . . . According to governmental statistics, there was a 1,600% rise in hate crime incidents right after 9/11. After that, the incidents came down, but once again have gone up. Most importantly, many hate crimes are not being reported because people are so afraid.”

Studying the Elusive Audience

Consumers, Readers, Users, and Viewers in a Changing World

Radhika Parameswaran

ABSTRACT

This introductory chapter outlines the recent evolution of audience research, focusing on the ways in which the field has addressed the theoretical, economic, cultural, and technological currents of the moment. I argue that audience studies has not only survived the backlash against its populist tendencies in the late eighties to mid-nineties, but it has also thrived and expanded to include a range of audiences, media genres, modes of audience engagement, and institutional and international sites of reception. This chapter explains the volume's contributions, its organizational structure, and the intellectual and empirical terrain of audience studies that the book's remaining chapters cover.

A group of women friends presenting papers at the International Communication Association's May 2011 conference in Boston decide to go to lunch. I am one of the fortunate members of this group. We sit down in a restaurant, and soon after we order our food, the sound of several conversations and of loud laughter begins to fill the space in between and around us. I mention that I had just seen the film Bridesmaids at home in Bloomington, Indiana, with a friend. The whole group is now listening to my reactions to the film, and, in a matter of minutes, others jump in to offer their own critiques of the film's take on weddings, girlfriends, romance, divorce, loyalty, beauty and body size, homophobia and heterosexuality, bi-racial celebrities, and humor and comedy. Already disgusted with the

politics of *Bridesmaids*' stories of gender relations, class, and sexuality, one woman in the group vows, there and then, that she would NOT watch the film. Another friend from the group returns home to Illinois, watches the film a few days later, and then submits to all of us, via e-mail, a humorous and insightful essay on the film's limitations. At about the same time a male relative from India, who had watched this comedic "chick flick" film in Delhi, sends me an e-mail to inquire about "real weddings" in America, and if indeed bridesmaids could interfere so much in their friends' weddings. His question reminds me of similar inquiries that acquaintances in the US made about Hindu weddings after they had seen the film *Monsoon Wedding*.

Bridesmaids returned to my life later in September, when students began trickling into my office to talk about their summer, and one student, who had seen the film too, said: "I was laughing and frowning at the same time. I was disturbed by my own laughter. I blogged about my responses with friends."

* * *

My anecdotal recounting of *Bridesmaids*' idiosyncratic circulation within the interpersonal and mediated arteries of my social and professional life is by no means "representative" of some larger universe of film viewing practices or of audience responses to this film. Yet, in the midst of working on this book on audiences, the discursive shadows of *Bridesmaids* that followed me for several weeks reminded me of the ways in which media and popular culture act as conduits and conductors for that other stuff, which we call "culture," and in the process of "charging" dispersed audiences their texts sometimes become the breeding ground for culture itself. Whether it is the news of turmoil in Syria and of the fragility of a European Union in crisis reaching numerous global publics or the global reception of *Slumdog Millionaire* on fan websites, old and new media forms and their audiences, users, browsers, producers, and consumers are constantly bringing one another into being, with corporations, governments, social movements, and individuals who are positioned within unequal hierarchies of power, acting as midwives of the public sphere. The richness of audience experiences in a world in which the media are increasingly bleeding into, traveling, contaminating, animating, and permeating everyday life has attracted some of the best debates in the academy over structure and agency, reality and fantasy, Althusser's "hegemony" and De Certeau's "tactics," cultural imperialism and hybridity, uses and gratifications and oppositional decoding/resistance, Foucault's subjectivation and Marxist determinism, globalization and localization, and patriarchal pedagogies and gendered pleasure.

Joining and enlarging these invigorating debates among varied disciplinary thrusts and research traditions, *Audience and Interpretation*, Volume IV of the *International Encyclopedia of Media Studies*, aims to provide a state-of-the-art overview of theoretical and methodological developments in audience research, case studies of empirical work amidst different audiences, and reflections on productive future avenues that can advance the academy's endeavor to grasp the slippery and morphing concept of the

audience. Many of this volume's chapters do not treat these topics separately; instead, the contributions here often weave together theory, reflections on method, analysis of findings, and discussions of research approaches in order to give us integrated visions of the audience. The chapters' geographic and cultural terrain encompasses a wide range of countries: Venezuela, India, China, Japan, France, Singapore, UK, USA, Australia, Korea, South Africa, and Brazil. Twenty-seven authors from different parts of the world have come together in these pages, to converge at the conceptual site of the "audience." Readers of this book will be exposed to knowledge of different audience formations, a plurality of cultural and demographic spaces of reception, and diverse kinds of media genres, forms, and formats. The volume's content populates the field of audience studies with an unruly and heterogeneous sample of topics – children's media, online and television news, activist media, telenovelas, books and mega-bookstores, state-sponsored television dramas, social media, Bollywood films, plays, health communication, amusement parks, documentaries, reality television, and religious programming – a sample that generates new insights, revisits established concepts, and challenges the very notion of the "audience" itself.

The spectrum of methods utilized and presented across the chapters encompasses focus group research, interviews, participant observation, immersion in cultural and media environments, surveys, and auto- and family ethnography. While some authors present critical reviews and overviews of audience research in particular areas of the field, others take us through complex historical and transcontinental itineraries, which traverse the landscape of their work. Yet others deploy reflexivity as a research instrument, to enlighten readers about the intersections between fieldwork and family/personal life, between public knowledge and private/domestic spaces, *and* between the subject positions of researcher and audience member, or insider and outsider. While many authors present us with agendas for future research in their areas of expertise, in the case of chapters on non-Western nations, where the project of audience research has barely been inaugurated, authors devote a substantive portion of their work to outlining gaps in our knowledge of audiences in the midst of dynamic and flourishing media ecologies where the footprints of television, film, and newspaper apparatuses are inviting large sections of the populace to inhabit their upwardly mobile spaces of viewership and readership.

The Current Moment of Audience Studies

If we could imagine a series of brief audio press releases that greeted readers when they picked up this volume on audience studies and opened the cover (like the singing Hallmark cards), a few of these releases' audio headlines would announce the following: "Audience studies is not dead," "The audience never died, it is breathing, jumping, running, and leaping," "Audience studies staves off rigor mortis," and "Audience studies survives near death experiences." For scholars new to media

studies, these announcements might need some historical perspective. When I was finishing up graduate work in the US and writing a dissertation project based in ethnographic audience research set in India in the early to mid-nineties, that was a time when a backlash against audience studies had been brewing steadily; and this skepticism eventually gained full momentum just as I had wrapped up my project. Summarizing the dismissive tone and content of some sweeping critiques of the nineties that cast the entire enterprise of audience studies as banal, regressive, pro-capitalist, and naïve, David Morley (2006) writes that far too many scholars have been eager to suggest that “work on the complexities and varieties of media consumption has led us up a blind alley – with John Fiske usually cast as the evil Pied Piper who led us astray” (p. 102). Morley, a pioneer in audience studies, points out that it was fair to “argue that some recent audience work has exaggerated, and wrongly romanticized the supposed power and freedoms of media consumers,” but it was also equally shortsighted to imagine that a return to simple-minded models of media power or to the politics of false consciousness could solve these problems (p. 102). Ann Gray (1999) notes that the backlash of the nineties also had its gendered dimensions, especially when critics lamented the shift that audience studies had precipitated, from masculinist “real-world” concerns to low-brow popular culture consumed within domestic spaces (read women’s consumption of popular culture).

Taking up the ethnocentric tenor of arguments that advocated “moving on” from the seemingly “banal” project of audience studies, Vamsee Juluri writes eloquently about the problems I struggled to articulate 15 years ago, when discourses of disenchantment and closure greeted me at conferences:

As someone entering the field in the mid-1990s, I wonder what it means that the high moment of audience studies seems to have passed, perhaps to travel, like old American sitcoms to the rest of the world [. . .] [T]o risk abandoning the project of audience studies when the rest of the world is only beginning to enter audiencehood (in the sense of thirty channel platters and so on) is to forsake, as postcolonial writers have argued in the context of other post-al predictions, the sense of representation and intellectual practice altogether. (Juluri, 1998, p. 86)

My own thoughts at the time were: “Can Ien Ang’s work on *Dallas* viewers in the Netherlands stand in for the rest of the world?” Expanding on Juluri’s essay and on Timothy Gibson’s (2000) constructive ideas to engage structures of power in ethnographic work, my own publication “Resuscitating Feminist Audience Studies” also argues that audience studies’ new journeys in Asia, Africa, and Latin America’s postcolonial *and* globalizing contexts could generate fresh questions and concerns that were capable of liberating the field from the tired binaries of “duped versus autonomous” or “active versus passive” subjects (Parameswaran, 2003). Again, as Morley cautions us:

What is needed here is not to swing, in our despair, from a romanticized vision of audience empowerment back to an unreconstructed politic of media manipulation, but rather, as Clifford Geertz once put it, to vex each other with ever greater precision in attempting to clarify the issues at stake. (Morley, 2006, p. 104)

Vexing each other with a stimulating palette of questions, the authors in this volume join a community of other scholars – who have published books, articles, book chapters, and essays – to help audience studies not only defend itself from any lingering effects of the backlash, but also thrive and grow in productive directions, which do not simply advocate throwing out the old to celebrate the new or avant garde. David Morley (2006) candidly observes that neophilia and facile new revisionism – with grand claims to change the field by exorcising the past – often masquerade as genuine intellectual progress: “the one thing I do not think we should do is to airily dismiss previous work as if we all, obviously, ‘know better’ than that now. That way lies hubris” (p. 112). I agree. This volume’s contributions mark intellectual progress by constructively building on, stretching, revising, and assessing the legacy of previous research in the field. Looking back on the last decade, we can see that audience studies has matured across the spectrum of constituents it could reach – from publications that target scholars and students in interdisciplinary graduate seminars (Bird, 2003; Brooker & Jermyn, 2003; Hagen & Wasko, 2000) to shorter and more accessible texts for beginning student researchers in media and cultural studies (Briggs, 2010; Gillespie, 2005; Ross & Nightingale, 2003; Ruddock, 2007). The scope of recent work in audience studies spans the continuum of academic formats and genres, from robust conceptual speculations on research terminology and analytic approaches, the implications of particular institutional investments in the “audience,” and the impact of new media to empirical work among different kinds of media audiences and audiences in non-Western locations that are witnessing dramatic economic and cultural transformation due to globalization.

What are some key contributions of recent scholarship in audience studies? What new and regenerative routes for knowledge production are scholars mapping to help us understand audiences in a changing world? I sample and review here, in a highly selective manner, writings in audience studies that offer evidence of the field’s continued potential to engage with some of the most important and exciting conceptual, cultural, technological, political, and historical concerns of this century. My discussion here cannot do full justice to the breadth and depth of the work cited, because my goal is to acknowledge key themes rather than cover extensively the entire literature in audience studies.

What recommendations have scholars made to strengthen the methodological and conceptual scaffolding of audience studies? One stream of theoretical scholarship on historical and ideological conceptions of the audience constructively merges the ideas and projects of fields and traditions that are often slotted into binaristic and irreconcilable paradigms, namely political economy and ethnography, mass communication and cultural studies, journalism and popular culture, and qualitative and quantitative research. Webster’s analytic rubrics of the audience as “mass,” “outcome,” and “agent” elegantly unify conceptions of the audience across such diverse institutions as marketing and ratings enterprises and policy and academic fields and across qualitative and quantitative audience models that include film theory, media effects, literary criticism, reception and audience studies, and early

propaganda research (Webster, 1998). Webster writes that the way forward should be to incorporate more creative borrowing of interdisciplinary concepts and analytic tools, relinquish the impoverished active/passive interpretive model, and pursue an enlightened empiricism that makes room for synthesizing a number of research methods. In an otherwise spirited debate where they outline disagreements with one another, Barker and Morley, seasoned veterans of audience studies, reinforce Webster's more inclusive model of empiricism when they concur that it is time to cultivate more synthetic methodological approaches to audience research that are less bifurcated, more pragmatic, and more attentive to the needs of the questions at hand (see Press, 2006). Goran Eriksson (2006) also pursues this productive line of inquiry, which seeks to bridge the gap between qualitative and quantitative research. As Eriksson notes, by "freeing itself from the empiricist conceptualization of generality as representativeness" (p. 42), ethnographic audience studies can continue to explore the potential for generality in relation to "the domain of the deep structures of reality" (p. 32).

Marrying the textual impulses of rhetorical criticism in communication studies with empirical social science research on audiences in media and cultural studies, Jennifer Stromer-Galley and Edward Schiappa (1998) pursue an innovative goal of advancing what they call the "argumentative burdens of audience conjectures" in close readings of popular culture texts where authors make claims concerning the "determinate meanings of the text or the effects of texts on audiences" (p. 27). Stromer-Galley and Schiappa carefully review examples of rhetorical/textual criticism in order to identify and parse out such "audience conjectures" and claims, and then they make specific recommendations for audience research that would help to support and enhance these scholars' gestures toward audience reception. In an intriguing move, they design and implement an audience study project that follows up and tests claims made in 1995 by Thomas Goodnight in an essay on the films' *Jurassic Park* and *The Firm*, and in the end they write that wording in scholarly writing matters and that audience research is valuable for assessing the "social and political significance of popular culture texts" (Stromer-Galley & Schiappa, 1998, p. 55). In an excellent illustration of Webster's call for more interdisciplinary dialogue to enrich audience research, Helen Wood (2007) points to the limits of most textual analyses of television talk shows that import literary methods to deconstruct the complex and multidimensional – oral/audio, visual, performative, and linguistic – architecture of electronic media. Wood applies an "interactive" analytic lens – an approach that is inspired and informed by linguist Volosinov's insistence on studying verbal interaction and the dynamism of "multi-accentuality" in dialogic linguistic interactions – to examine the "generative" manner in which viewers watch and engage with talk shows. In Wood's detailed and fine-grained exploration of women's utterances and verbal responses to talk shows' parasocial and intimate address, the *peculiar form* of broadcast media and the communicative acts they facilitate rise to the surface, thus demonstrating the possibilities of redrawing the boundaries between speech communication and mass communication in audience research.

Publishing their essays in the same year, Shimpach (2005) and Bratich (2005) guide their readers through the historical tracks of disciplines and institutional forces to offer us two different re-visions of the audience: one that interrogates the collective and industrialized forms of “labor” that produce audiences, and another that utilizes Hardt and Negri’s concept of the “multitude” to problematize the ontologies of the audience in different academic discourses. For Shimpach, the tension between the very “real” practices of audience engagement with media technologies and the discursive construction and imagination of the audience in different institutional sites leads us toward a third way of taking seriously the affective, material, and performative practices of audience labor. Shimpach (2005) analyzes ethnographic audience research, Marxist-influenced writings on the commodity audience, and the history of audience reconnaissance and management techniques in the US motion picture industry, to argue that, “with labor knowingly foregrounded, differences in what is meant by audience in individual instances can be strategically subsumed under the rubric of a single over-riding conceptualization that at least implicitly, and as often explicitly, is premised upon the idea that the audience for the culture industries performs productive labor for itself and for those industries as a condition of being an audience” (p. 357). Jack Bratich (2005), who notes at the beginning of his essay that the “fugitive” and amorphous character of the audience ensures the longevity of audience research, adopts Hardt and Negri’s social theory of subjectivity – specifically, the idea of “multitude,” or the “creative capacities of cooperative social forces” to denote constitutive power – in order to “problematize” the early discursive production of audiences within the three sites of propaganda (vulnerable and reactive audience), marketing (desiring audience), and moral panics (vulnerable yet threatening audience). His essay concludes with a useful outline of the implications of his ontological treatment of the audience for empirical audience research, particularly the integration of “information technologies, communication processes, and strategies of biopolitical control,” and for the active audience model (pp. 261–262). Bratich’s historical and theoretical exploration of the multitude’s metamorphosis – its various incarnations of audience power – offers ideas to strengthen diverse traditions of audience research.

In addition to fleshing out more collaborative models of research that cut across boundaries, critics have also debated the limits and potential of anchoring audience studies to new conceptual paradigms, which address the media’s relationships with public education, the nation, and the unruly realities of global audiences’ participation and consumption activities. Livingstone (2008) addresses the recent migration of audience or user engagement – such activities as decoding texts or participating in the formation of imaginary communities – from the vocabularies of ethnographic audience studies to the pedagogic project of media “literacy,” which has possibilities for democratizing outcomes, but is also packaged, quite often, in normative terms by neoliberal institutions. She writes that the terminology of “literacy” is gaining ascendancy in multiple zones of public discourse: “Everywhere it seems we hear of cyberliteracy, digital literacy, computer literacy, media literacy, Internet literacy,

network literacy and so on, and this it seems, points to a new discourse whereby the academy can examine, critically or otherwise, with media and communication technologies” (p. 53). Measuring the literacy model’s fit for different media technologies, media genres, and ideological projects of audience emancipation, Livingstone concludes that, if developed further, the text–reader metaphor of critical audience studies can still retain its usefulness; however, it is also important for media scholars to engage with audience studies’ overlapping interfaces through the spreading literacy metaphor. Morley (2006) writes that the framework of “cultural citizenship,” which expands statist conceptions of political citizenship to the media’s capacity to strengthen civic culture and foster individuals’ and communities’ feelings of belonging or alienation, could be a promising conceptual hinge for audience research, and some recent work in audience studies has pursued the study of cultural citizenship in relation to audience subjectivities (Banet-Weiser, 2007; Dolby, 2006; Harindranath, 2009; Muller & Hermes, 2010). Adrian Athique’s (2008) essay sketches the notion of a “cultural field” as an alternative structure for imagining audience communities as sites of relational social practices rather than as discrete populations, and thus it proposes a timely revision of traditional models of fieldwork, which followed demographic classifications and privileged narrative cohesion by “analyzing trends in media use among a categorically defined community” (p. 30). A cultural field approach, according to Athique, would account for a complex matrix of situated practices that constituted one another:

A more sophisticated, or “situated,” ethnographic approach towards media audiences takes into account the heterogeneity of the population in question and the internal contradictions which are likely to exist within it. It also recognizes the external influences that both reinforce and destabilize the social identity of the group. In its most convincing form, a situated approach seeks to evaluate the whole range of cultural practices present within a sampled group; these might be variously constituted as forms of production–reproduction, import–export and relation–translation. (Athique, 2008, p. 31)

For Athique (2008), the notion of cultural field would imply that a study of film viewing would cast its ethnographic net wide enough to include fans and non-fans, cultural insiders and outsiders, and a host of other possible relational groups, so as to conceive of the cultural field as “a radial zone of influence within which viewers engage with a cultural artifact for different purposes, and from different standpoints, generating different meanings and pleasures” (p. 38).

Scholars in audience studies have also debated the implications of the spread of computers and of the Internet, as well as the implications of their associated technological convergences, for the future of audience studies (Alasuutari, 1999; Caraway 2011; Costello & Moore, 2007; Morley, 2006; Livingstone, 2004; Napoli, 2011; Newman, 2010; Sloan, 2009). While the spread of new media usage has generated unique formal and informal terminologies for our everyday engagement practices and subject positions – of users and browsers; lurking, defriending, e-mailing, tweet-

ing, and googling; netiquette and netizens; online and offline interactions; phishing and cyberbullying; and so on – Livingstone (2004) and Morley (2006) urge us to err on the side of caution before we rush to renew utopian or ahistorical ideas of powerful media effects. As Morley writes, a predominant strain of new media theory “returns us, ironically enough, to a place we started out from long ago – to a technologically determinist version of hypodermic media effects [. . .] it is as if technologies themselves had the magical capacity to make us all active – or in some visions, even to make us all democratic – a strange form of media effects indeed” (p. 117). Morley questions the institutionally funded “new orthodoxy” of theories purporting to capture the digital age, which argue that media studies has “got it all wrong for the last 20 years,” and he reminds us that the “rhetorics of the technological sublime,” which surround the new media, also accompanied such earlier technologies as the telegraph (p. 115). Livingstone’s essay on “What Is the Audience Researcher to Do in the Age of the Internet” (Livingstone, 2004) executes precisely Morley’s cautionary advice to consider the usefulness of the “old” – existing theories and methods – for the “new.” She starts with a number of insights from television audience research that can inform work on new media users, including the relevance of active audience theory for the “selective and self-directed” ways in which new media audiences are “producers as well as receivers of texts,” the constraining influences of capitalist media industries on audience responses, and the connections between media engagement and “analytic competencies, social practices, and material circumstances” (p. 81). Posing a series of excellent questions for future research on Internet audiences, Livingstone outlines the different and perhaps “magnified” methodological challenges that new media practices – surfing, game playing, instant messaging, privileging content over form, and consuming texts that are multimodal, hypertextual, and ephemeral – pose for issues of observation and access in empirical and ethnographic audience research. Taking on the vital issue of ethics in the context of qualitative audience research afforded by the Internet, Amanda Lotz and Sharon Ross (2004) describe the ethical considerations that must guide the research process, beginning with entering and monitoring chat groups and forums, procuring informed consent, ensuring a fair and dialogic exchange with the respondents, willingness to change research designs, accepting withdrawals and refusals from participants at any stage, and maintaining vigilance to protect subjects’ anonymity.

While scholars have genuinely lamented the fact there is far more abstract writing about audiences than work that is based on empirical research, it is also true that the field has made progress in studying both international audiences and audiences that have been historically excluded from the field, either due to marginalization or because they were considered too normative and powerful. Cultural anthropology and sociology’s discovery of the role of media in shaping and producing culture has helped audience studies gain a more international visage; feminist anthropologists and sociologists have carried out fieldwork in India (Mankekar, 1999; Derne, 2000; Dickey, 2007), Egypt (Abu-Lughod, 2005), and China (Friedman, 2006) to produce detailed ethnographies of audience responses to television drama and film in relation to discourses of

class, colonialism, caste, gender, and nation. Cultural anthropologist Mark Peterson's (2010) singular work on journalism's reading publics in India demonstrates the depth of contextual data on news literacies that only careful ethnographic work can yield; his analyses of such phrases as "taking the newspaper," "raddi," and "common man," which circulate among his informants, reveal the profound embeddedness of news in webs of social relations. Unlike in the early to mid-nineties, in the fairly barren landscape of global audience studies prevailing then, now we have a modest corpus of empirical research in the communications academy, which has explored, for example, the contours of media and popular culture audiences in such locations as Japan (Condry, 2006; Darling-Wolf, 2000, 2004; Muramatsu, 2002; Takahashi, 2010), Malaysia (Carstens, 2003), Australia (Aly, 2010; Holloway & Green, 2008), India (Juluri, 2003; McMillin, 2003; Parameswaran, 2002, 2003; Rao, 2007), Venezuela (Acosta-Alzuru, 2003, 2010), Brazil (La Pastina, 2004), South Africa (Bradfield, 2010; Strelitz, 2004), Singapore (Trager, 2008), Lebanon (Kraidy, 1999), China (Haiqing, 2006), and Denmark (Drotner, 2004). Several of the pioneering authors cited here are represented in this volume and, most importantly, their projects in global audience studies have propelled vigorous dialogue with other humanities and social science disciplines on phenomena related to globalization's spread – cultural imperialism, consumerism, neoliberalism, hybridity, postcolonial class formations, gender and nationalism, emerging markets, anti-globalization movements, and multiculturalism.

Some of the audience studies projects in different nations around the world, along with a growing body of work in the US, also foreground the cultural practices, media uses, and responses of communities whose profiles do not approximate to the historically dominant white, heterosexual, Christian, and middle-class subject position: examples of such work in the US include Mary Gray's (2009) ethnography of queer rural youth's consumption and production of online spaces; Vivian Barrera and Denise Bielby's (2001) qualitative exploration of Latino viewers' reactions to telenovelas; and Lakshmi Srinivas' (2002) and Aswin Punathambekar's (2005) research on film reception among members of the Indian diaspora. Reflecting the shift in gender studies toward critiques of manhood and masculinity, audience research has also departed from its long-standing focus on women audiences and femininity, to address the ways in which men take pleasure in and utilize media in order to construct their identities (Derne, 2000; Hoover & Coats, 2011). Finally, rare recent work (Davis, 2005) on the strong media effects of communications on investor behavior and trading patterns in the London Stock Exchange (LSE), which was based on interviews with elite fund managers, exemplifies the value of "studying up" in audience research, namely tracking and observing the lives of privileged groups in society.

The field of audience studies has also made advances in incorporating reflexivity, a key and indispensable aspect of qualitative research that facilitates ethical, flexible, and rigorous research design and demystifies the research process for other communities of scholars, and especially for beginning researchers about to embark on their first major projects. Far from encouraging narcissistic navel-gazing, audience researchers' reflexivity has produced thoughtful and constructive accounts that dwell

on fieldwork dilemmas, on the outcomes of using particular research methods, and on the challenges of navigating relations between and among research subjects. Elizabeth Bird (2003) embraces reflexivity in the introduction to her book, so as to offer instructive lessons on methods; she argues that “methods matter because the choices made, along with the very characteristics of the researcher, play into and ultimately shape the conclusions of any research” (p. 9). Bird’s candid evaluation of the methodological choices and strategies – soliciting letters and conducting telephone interviews – that she employed in some of her previous work both helps readers understand the ways in which gendered norms shape “data collection” and dispels the myth that telephone interviews are always necessarily a poor substitute for personal interviews. She also provides details of how “researcher-absent methods” where participants tape their reactions to, and their interactions with, media without the ethnographer being present allow scholars to gather data under research conditions that approximate closely the everyday lives of media audiences.

Essays probing the intersections between personal biographies/identities and the trajectories and peculiarities of fieldwork undertaken in particular locations by media and cultural studies scholars – essays published in the multidisciplinary journal *Qualitative Inquiry* – flesh out the concrete ways in which researchers act as embodied instruments of knowledge production in qualitative research (Murphy, 2002; Parameswaran, 2001). The interrogation of researchers’ subject positions in audience ethnographies has also expanded the horizons of debates over the politics of racial identity; for example, Vicki Mayer’s (2005) deliberations on “narcissistic whiteness” and “defensive whiteness” challenges whiteness’ invisible normativity and the tendency in scholarship to essentialize whiteness within ahistorical and functionalist “narratives of structural dominance or individual vulnerability” (p. 148). Reflexivity, as Lotz and Ross (2004) argue, is even more vital for research ethics when we mine or study audiences in the Internet age, where both scholars and subjects have to navigate the insecure and murky waters of privacy, anonymity, and intimacy in cyberspace. While audience studies must continue to deliver on its commitment to reflexive fieldwork and writing practices, these examples of sustained and serious attention to the research process get us closer to the use of “reflexivity to alleviate discrepant power relations” and to acknowledge power differentials in a manner that utilizes and advances feminist anthropology’s commitment to ethical innovations in theoretical approaches and research methods (Abu-Lughod, 1988; Behar, 1993; Clifford, 1986; Gordon, 1988; Lotz, 2000, p. 453).

Distinguishing Characteristics and Organization of the Volume

This volume picks up and builds on the current momentum of work in audience studies outlined in the previous section. Collating and bringing together major scholars

of national and international reputation and bright emerging researchers in the field, many of the chapters in this book synthesize and provide larger frameworks to interpret their authors' empirical studies and theoretical contributions and to specify productive questions, which can propel future debates and investigations. The volume's novel and distinguishing features extend to the first and leading part, which offers curricular, conceptual, and methodological strategies to strengthen the future of the field, and also to a part dealing with new media genres, which encompasses news, feminist online forums, institutional efforts to control and manage online audiences, and girls' uses of new media. The volume's integration of a wider range of subjects – such non-traditional topics as women audiences of health communication, consumers of multinational bookstores, and activist audiences are included here alongside more traditional audience studies content on viewers of popular culture – contributes still further to scholars' ongoing efforts to make the field more responsive to developments in the world and more inclusive of multiple audiences. Two chapters, one on China and another on India, which review recent media developments in these rising powers and emerging market nations in order to chart yawning gaps in what we know about audiences there, offer contributions that are not available in existing books. While edited collections often include a chapter or two where authors focus on reflexivity, this volume devotes a whole section to it, and the chapters here present different generic iterations of reflexive practices, from authors' deliberations on various stages of data analysis to the rare instance of work that showcases *audience members'* reflexive interpretations of research encounters. The chapters assembled in this book also represent different audience research traditions that have emerged from mass communication, cultural studies, media sociology, feminist anthropology, feminist media studies, and communication studies.

The volume is divided into five thematic parts, which address, respectively, future directions for the field, reflexivity, global media audiences, new media technologies, and citizenship. Some of the chapters could easily belong in two or more sections, and this ambiguity illustrates the hybrid analytic and methodological overlaps that characterize work in audience studies. My ensuing discussion of the different parts of the book and of the chapters will further highlight the volume's fresh perspectives on and new intersections with ongoing conversations about theory, fieldwork, methodology, data analysis, politics of research, and knowledge gaps in audience studies.

Part 1

The first part, "Expanding the Horizons of Audience Studies," takes up the challenge of considering trajectories for the field to multiply and mature further, whether this results from a commitment to "growing" new generations of scholars or from tackling different approaches to theory, methodology, and fieldwork – approaches that can lead us beyond the dualistic constructs of active/passive and duped/autonomous audiences. Pedagogy for the graduate curriculum still presents a mysterious and

uncharted terrain, especially when we compare it to the dozens and dozens of books and articles on undergraduate pedagogy. Gigi Durham's chapter "The Audience in the Graduate Curriculum: Training Future Scholars" in Part 1 may be the first of its kind: that is, the first to undertake an inventory and an account of the pedagogical challenges – from issues of access and human subjects review boards, to ethics and power in the field, to data collection, and to writing media ethnographies – that arise in courses designed to train students to study audiences. The process of teaching graduate students to manage audience studies projects occurs within formal classrooms and educational settings, in supervised research contexts, and in the less controlled and distant environments of fieldwork. Given the difficulties of studying human subjects, who can defy and rebel against the most well-planned research designs (unlike compliant and accommodating "textual" subjects), it is important for the academy to create public knowledge around the successes and failures of the graduate pedagogies that educate future scholars. Durham's essay takes on greater weight when we acknowledge the fact that some of the best and most innovative audience studies projects are birthed in the early stages of scholars' academic careers.

Patrick Murphy and Kim Trager-Bohley, whose chapters sit at contrasting ends of the spectrum, address methodological considerations that might shape the research designs of audience studies in the future. Murphy outlines the affirmative *and* pragmatic benefits of short-term fieldwork, or of abbreviated site visits, in an era when media researchers in the US academy are increasingly strapped by lack of time, funds, and institutional support. Trager-Bohley argues for the opposite, that is, for an expanded, flexible, and responsive vision of ethnography as a multi-sited endeavor whose open-ended pursuit of sites and subjects approximates Athique's (2008) notion of a more unbounded "cultural field." In the last chapter in this section, CarrieLynn Reinhard and Brenda Dervin broaden the theoretical horizons of audience studies. Their chapter explains the conceptual paradigm of Dervin's "sense-making methodology" and offers illustrative examples of data from research projects to introduce readers to the strengths of this comprehensive approach. Sense-making methodology, as these authors show, allows scholars to study audiences at individual and collective levels, facilitates more expansive and immersive projects, and accommodates a matrix of contextual factors that affect audiences' situated interpretations of the media.

Part 2

The second part focuses on reflexivity in audience research; authors here are using different theoretical and political lenses and multiple narrative approaches to flesh out their particular stances on reflexivity. Foregrounding reflexivity through the creative architectural form of her essay, Carolina Acosta-Alzuru draws on the organizational metaphor of the "itinerary" in order to turn a potentially dry and pedestrian plotting of her work across time into a captivating "travelogue" that chronicles the changing landscape of the research strategies and methods she has employed to

study telenovelas in Venezuela. Acosta-Alzuru writes candidly about the difficulties she navigated to arrive at more intimate and imaginative renderings of her research: “They [variations in my writing tone] offer evidence of my own struggles to detach myself from the more traditional (and ‘safe’) forms of academic writing that I was socialized to pursue, and instead allow personal reflection and critique to govern my writing and become the heartbeats of my prolonged academic immersion in the study of telenovelas.” Similarly blending his research on children’s television and his parenting practices with an ethnographic portrait of his own family’s viewing practices, Matt Briggs crafts a forceful and intriguing narrative, peppered alternatively with television’s scripts and family transcripts, which articulates the concept of “force” as a means to deconstruct the intricate process of humans’ meaning-making processes as well as to unpack audiences’ deep emotional and ideological investments in media culture. Briggs rightly points out that audience research needs to be boosted through proposals for “methodological inventiveness,” which can in turn foster innovation in theory-building and help us achieve “thickness” in our research narratives. Acosta-Alzuru’s and Briggs’ chapters remind us of the importance of writing and of narrative form – a neglected topic in audience research – in conveying our representations of audience research. For them, reflexivity is as much an inner cognitive and affective process as it is a research strategy that enables them to *externalize* their audience research projects through the art of writing and through narrative choices.

Lynn Schofield Clark mines reflexivity within her larger project on US families’ uses of new media in order to build a multilayered story of an “ethnographic dilemma”: this dilemma centers on a young girl, who engaged in excessive and sometimes inappropriate digital and mobile media use. Taking us backstage into the green room of qualitative research, where the messy and intimate processes of data collection unfold, Schofield Clark highlights the contingent and contextual forces that shape the writing and publishing formats of audience research. She argues that reflexivity helps us understand better the ways in which researchers’ identities, the demands and discourses of multiple stakeholders (university students, research assistants, members of the public, and various academic research communities), and researchers’ measures of what various reading publics expect influence the public audience studies research narratives we produce. While Schofield Clark digs into the inner recesses of fieldwork for one project, Fabienne Darling-Wolf takes an expansive view across time and space, to consider the challenges and opportunities that her identities present for her as a white European scholar who grew up in France, as an academic who lives and works in the US, as a researcher who carries out fieldwork in Japan, and as she moves across multiple geographic and institutional contexts. Darling-Wolf anchors her empirical accounts of reflexivity – of trying to understand different national and ethnic audiences’ responses to media in a connected global mediascape that also bears the imprints of history – to her advocacy of a “translocal” theoretical approach to audience studies that can engage with the criss-crossing networks of media flows.

Finally, Katherine Sender’s unusual treatment of reflexivity in her chapter, in the context of audiences for reality shows, pushes the boundaries of scholarship on this

topic by investing *audiences*, not just scholars and ethnographers, with the power to enact forms of reflexivity, that is, to exercise the critical capacity of achieving distance from the “self” and of projecting different “selves” that speak to one another. Such practices of reflexivity, which audiences perform and enact in research situations, are not simply “collateral damage” or incidental outcomes of audience research; in fact, as Sender shows, these productions of the viewer’s self that arbitrate the circulation and reception of reality shows challenge the functionalism of users and gratifications theory and the regulatory/disciplinary emphasis of governmentality critiques.

Part 3

The seven chapters in the third and largest part of the volume – “Finding and Engaging Global Audiences” – carry out three crucial tasks: they provide case studies of empirical research in South Africa, Brazil, and India; they offer critical reviews of the literature on audience studies in China and India; and they propose prescriptive theoretical and methodological models of research to study audiences in East Asia and Australia. Shelley Bradfield’s chapter on South African women television viewers and Vamsee Juluri’s chapter on Indian film and television viewers contribute new knowledge of audience responses to the media in postcolonial and “emerging market” nations that are grappling with the challenges of bridging racial, religious, class, caste, and cultural differences in the midst of economic and cultural globalization and its aggressive incursions. Bradfield’s analysis of a diverse group of South African women’s interpretations of the television drama *Home Affairs*’ fictional tales of race, gender, class, sexuality, and nation illustrates the vicissitudes of the state-sponsored travels of multiculturalism into the intimate domestic and affective spaces of citizens’ lives in this post-apartheid nation. She peels off and takes apart white, black, and a mixed ethnic and racial group of women audiences’ different “globalized” and “localized” expressions of identification and disconnection with the drama’s characters in order to demonstrate that multiculturalism’s rhetoric of equality rings hollow in the face of the struggles that disenfranchised citizens continue to face. Juluri’s chapter, which showcases his ethnographic research in India, also exemplifies the unique strengths of ethnographic audience research. His interviews and conversations with audiences allow him to bring to light the extraordinary complexities of assumptions about human nature and reality that mediate television viewers’ seemingly “irrational” or “strange” responses to important issues related to family, nation, and religion in media culture. The author’s elegant and robust integration, under the conceptual umbrella of the “real,” of findings from his multiple projects of audience studies undertaken over time and across media genres also affirms the enduring possibilities of ethnographic work to generate grounded and located theory, which resonates with the particular influence of historical and cultural forces on audiences’ responses to popular culture. Echoing Juluri’s longitudinal mode of contemplation,

which links together the author's various research projects, another chapter in this section, authored by Antonio La Pastina, synthesizes this researcher's long-standing ethnographic media research in Macambira, Brazil, aiming to consider audiences' responses to various aspects of the social and capitalist content of telenovelas – including product placement, gender roles, social marketing, and generic conventions. Steering global media research away from its elitist metropolitan biases, La Pastina gently guides us through the material and mediated terrain of rural Brazilian viewers' lives, to argue – in contrast to the liberatory and populist tone of early audience research – that telenovelas have contributed further to the urban–rural divide and to power hierarchies of class and cultural capital in this upwardly mobile globalizing country.

In contrast to these three chapters, which are filled with data from fieldwork carried out amidst media audiences, Hongmei Li's and Sunitha Chitrapu's chapters, which take a critical inventory of China's and India's mediascapes respectively, make a persuasive case for amplifying the empirical base of audience research in these two nations. Li's chapter juxtaposes developments in China's exploding media environment with trends and changes in media and cultural studies research, so as to identify promising areas for future research on Chinese audiences. Chitrapu's overview of India's film industry re-orientates the almost obsessive focus on Bollywood in film studies, to engage with Indian cinema's various linguistic sectors, which cater to this postcolonial nation's multiethnic and regional film viewing audiences. Bringing the material realities of political economy in conversation with the potential of culturalist ethnographic studies, Chitrapu charts the missed opportunities for audience research that scholars can harness to produce a richer, fuller, and more pluralistic portrait of film reception in India that interrupts the hegemonic hold of Bollywood in the academy.

Finally, a chapter on alternative regional audience formations in East Asia and another one on television and new audiences in Australia contribute new ways to think about theory and methodology in global audience research. Chua Beng Huat's chapter on transnational television – which augments the mission of recent scholarly endeavors to engage with global media counterflows that take us past US media and cultural imperialism (Iwabuchi, 2001; Thussu, 2006) – analyzes the implications, for audience studies, of the traffic in media flows between and among nations in East Asia. Stitching together existing work along with his own research, Beng Huat addresses a series of phenomena – dubbing as a form of semiotic alteration, audiences' paradoxical forms of identification with foreign content and artists, the politics of nationalism and transnational fandom, and the emerging fragile contours of a pan-East Asian identity – to fashion a conceptual model that will help other scholars conduct audience research that is sensitive to the regional inflections of global audience formations. Donell Holloway and Lelia Green, who dissect systematically the benefits of different methods that scholars frequently use in ethnographic research, begin their chapter by outlining the origins and concerns of audience studies in Australia. Dismantling the methodological edifice of their own work on families'

viewing practices and interactions with media technologies, they argue that keen observations of mundane and familiar domestic spaces and close attention to audiences' struggles with negotiations over media use can add texture and nuance to qualitative work based on interviews.

Part 4

The still nebulous and uncharted waters of new media audiences are the focus of the fourth section of the book. How can we conceptualize new audiences in ways that do not simply import the ill-fitting baggage of old media technologies? Does it still make sense to erect boundaries between producers and audiences in the online media environment? What are the dilemmas that ethnographers should anticipate when they study online audience communities? Fernando Bermejo's chapter in Part 4 argues that new media audience practices are threatening to disrupt the fragile consensus on definitions of the audience that were forged earlier among various competing institutions. He charts the evolution of audience measurement techniques within various media industries and in the advertising world, to foreground the fresh complications that the new media pose for the managerial needs of corporate imperatives; and he evaluates the routes, methods, and techniques that researchers have devised to measure Internet audiences. Deborah Chung's chapter takes on a similar task, of appraising audience behaviors and communication models in the universe of online news media – a growing industry that has wrought major transformations in the fortunes of the rapidly declining print news industry in the US. She surveys trends and developments in the arena of online news – the use of interactive tools, the emergence of social media, and citizen blogging – to suggest fruitful directions for empirical research that can shed more light on the ways in which readers are flocking to the converging news habitats of cyberspace.

New media technologies have also attracted the attention of feminist media scholars, and authors Shayla Thiel-Stern and Radhika Gajjala explore the emancipatory potential of girls' and women's cyber-activities and cyber-communities from feminist perspectives. Thiel-Stern's chapter notes that new and mobile media have opened up opportunities for girls to express their agency and to bridge the gulf between "passive" and "active" subject positions by being both consumers and producers; but she also cautions us that lingering hegemonic patriarchal structures, the corporatization of the Internet, and continuing problems of access should restrain scholars from overestimating technology's alluring fantasies of resistance and freedom. Radhika Gajjala's chapter takes us on a biographical journey through the episodes of her ongoing feminist research program on Internet communities and online spaces in conjunction with the material imperatives of offline phenomena. Gajjala's descriptions of how she acquired her knowledge toolkit of theory and methods to study the new species of online audience communities fabricates the subject position of the cyber-ethnographer as a bricoleur, a flexible and open-minded scholar who makes use of

various and serendipitous formal and informal knowledge resources to study the still unresolved research questions that crop up in the context of online media.

Part 5

The fifth and last part, “Empowering Audiences as Citizens,” scrutinizes audiences in their avatars as citizen subjects: chapters here approach formations of citizenship through the lenses of public health media, activism, news media, and performative and documentary genres of production. Linda Aldoory’s chapter assesses the contributions of existing research on health messages and health campaigns that have targeted women from the point of view of their capacity to improve the quality of health communication and thus to empower female audiences. Aldoory argues that the biomedical paradigm, which assumes a linear progression from awareness to behavior, media campaigns’ assumptions about audiences’ middle-class lifestyles, and models of research that ignore issues of culture and power have hindered the development of public health media and of messages that can genuinely assist women to take charge of their lives. This chapter’s focus on health communication in Part 5 adds a neglected topic to the archive of academic audience studies work that we have accumulated over the last 15 years.

Jennifer Rauch’s chapter casts a new light on activist citizens, who have typically been studied as producers and disseminators of protest media rather than as subcultures or audiences of media and popular culture. Applying James Carey’s model of ritual communication to activists’ practices of media engagement and reception, Rauch proposes that shifting from the transmission mode of activists’ communication to their ritualistic and symbolic patterns of media consumption will enable scholars to offer greater insight into the cultural formation and political mobilization of activist identities in the first place. Identifying and discussing activists’ media preferences and their skepticism toward purely technological forms of dissent, Rauch recommends areas for future study on those ritual forms of communication and reception that inspire and invite audiences to become activists. Kim Christian Schröder’s ambitious chapter synthesizes an extensive body of knowledge on audiences as citizens, aiming to create a historical typology and taxonomy of audiences. Schröder’s theoretical and analytic distillation of three decades of reception research classifies the literature according to the following five categories: hegemonic citizenship, monitorial citizenship, popular citizenship, participatory citizenship, and ubiquitous citizenship. The author fleshes out the impulses, concerns, and research designs of each stage of citizenship, providing representative case studies that further help readers grasp more concretely the intellectual contours and contributions of each of these five stages.

Volumes on audience studies rarely include material on performative genres or on documentary productions. The final chapter in the volume and in this fifth part

merges production and reception in order to address the issue of how alternative genres of communication and media – street theater, documentary film, and ordinary citizens’ digital media productions – invite audiences to participate in acts of witnessing and to enter cultural and political spaces whose mediated rhetoric interpellates them as engaged and concerned citizens. Activists’ street theater and grassroots organizations’ documentary films aspire to earn instrumental forms of political recognition and acknowledgment from their audiences, and the testimonial accounts of digital media productions seek to incite sympathy from, and to build solidarity with, citizens. The authors acknowledge the distinctions between these genres, but they also argue that the autobiographical, narrative, and public testimonies circulating in public spaces though the vehicle of these genres may compel audiences to shift their subject positions from being isolated individuals to becoming connected and politically engaged citizens who participate in social movements.

* * *

In closing, I propose with great optimism that this volume’s chapters offer evidence that the unfinished project of audience studies will continue to be an exciting and innovative area for future argumentation and debate *and* for future empirical research. Numerous chapters in this volume bring to light the intellectual cracks, gaps, and fissures in the field that generations of scholars ahead can deliberate over and choose to fill and repair. The field of audience studies is a vital and indispensable component of the ongoing larger projects of the still young disciplines of media, cultural, and communication studies, which seek to inform and educate citizens about the evolving ways in which media culture and technological forms intersect with the trajectories of human agency, the influences of historical patterns and global affairs, the contingencies of everyday life, and the endurance of institutional power structures. Indeed, as numerous other critics in audience studies have pointed out, the “audience,” both real and imaginary, constitutes the basic epistemological, material, and discursive foundation for the very existence and spread of mediated forms. The enterprise of scrutinizing the audience, as this volume demonstrates, can facilitate invigorating and constructive conversations between and among various streams of research and theoretical traditions that address production and political economy, texts and representations, psychology of media effects, qualitative and quantitative paradigms, and multiple and convergent media genres. At a time when media culture’s fluid representations of race, gender, class, sexuality, and nation are crossing geographic and political borders or erecting new boundaries to separate us into isolated and fragmented subcultures, creating knowledge of audience formations should take center stage in the academy’s mission to produce responsible and engaged global citizens, workers, consumers, and scholars.

I invite readers of the volume to join me and the authors here in our project to keep the audience alive and kicking.

Media Studies

The Interdiscipline of the Present and the Future

Angharad N. Valdivia

Media studies is a rapidly growing, widely relevant, and evolving field – an inter-discipline (Valdivia, 2003). While some scholars have bemoaned the loss of focus on process and effects, especially on milestone studies (DeFleur, 1998), others find the breadth and porous contours to be conducive to a worthwhile intellectual pursuit (Sterne, 2005). To be sure, between 1998 and the present, there has been a huge growth in interpretive and critical approaches, which have nonetheless flourished in the margins as the effects paradigm – the stuff of milestones – has firmly retained its central place in the field, at least in the United States and the Netherlands. Indeed, efforts to map out the diversity of the field of communication (Craig, 1999, 2001), which we might call the broader umbrella for media studies, yield a multiplicity of sometimes overlapping and other times mutually exclusive approaches. The terrain of contemporary media studies acknowledges that most of us live in intensely mediated environments, so that Livingstone (2009) writes on the mediation of everything, and Hay (2000) writes of refrigerator studies. The former expands on how media and communication are “ever more crucial in today’s world” (Livingstone, 2009, p. 13), and the latter asks us – as a field over a decade ago, while continuing to encourage us (Hay, 2010, 2011) – to consider the broader web of networks to which other technologies, such as refrigerators and toasters, contribute in terms of routines and practices that serve to mediate the world for us. The latter line of questioning has proven immensely prescient as many of us live in highly networked webs of media and communication, where not only can our location be pinpointed at any given moment thanks to elements in our mobile technology, but also, if we chose to, we can broadcast a narrative of our location and other audiovisual bits of information constantly to many – such as our hundreds of Facebook friends and Twitter or Tumblr followers.

Nonetheless, whether we are talking of old media technologies or institutions (see Nerone, Volume 1, *Media History and the Foundations of Media Studies*), we are witnessing the constitution of new audiences and a shift in traditional audiences (see Parameswaran, Volume 4, *Audience and Interpretation*) through the invitation offered by seductive content in a dynamically converging and synergized media environment (see Mazzarella, Volume 3, *Content and Representation*). The effects of these technologies and content continue to be measured and studied (see Scharrer, Volume 5, *Media Effects/Media Psychology*). While media platforms and patterns of production are converging, enduring tendencies toward concentration of ownership and control of media industries coexist with the emergence of new patterns of labor, practices, and updated forms of exploitation (see Mayer, Volume 2, *Media Production*, as well as some chapters in Gates, Volume 6, *Media Studies Futures*). This is not surprising given the rapidly expanding new media and communications technologies, many of whose functions replicate previous technologies while other uses (and abuses) bring new possibilities, utopian and dystopian, to the fore (see Gates, Volume 6). Unexpected global locations of nodes of influences result in previously unsuspected transnational alliances and networks (Castells, 2009).

As an early caveat to this triumphal celebration of media, I must remind readers that most of the above sentiment refers to a media-rich group that luxuriates in a wealth of networks and technologies. Yet we must not forget that even as I write this introduction at the very end of 2011, fully 50% of the global population have intermittent access to electricity. Mobile telephony may be widely spread, but the radio remains the most reliable global medium (see the *Journal of Radio Studies*). Beyond the fact that it is cheap, it neither relies on nor requires electricity or literacy, in English or any language. Furthermore, despite our current fixation with digital, wireless, and mobile media technologies, in times of crisis – whether natural such as a huge earthquake or in wartime – when the electric networks are down and we are thrown back into old school forms of media and communication, radio returns to its central location as a reliable and essential medium. So before you continue reading this introduction, or continue to read any of the absolutely outstanding volumes of this encyclopedia project, go out and buy yourself a radio – one that is both electric and battery powered. You might never need it, but if you do, you will be very relieved to have it.

The fact is that media are everywhere, and nearly everyone shares lifelong experience with and expertise on particular forms of media. Dating back to the 1920s – as identified both in Nerone, Volume 1 and Mazzarella, Volume 3, the study of media has been multi-modal and heterogeneous. Theoretical and methodological complexity has grown since the Payne Fund Studies. International, transnational, and global perspectives have become absolutely essential. Not that they ever were not, but now that media are produced, consumed, and circulated transnationally, media studies has to take this into account. Inclusivity of the heterogeneous components of the population in regard to the media has also grown. Scholarship that was once nationally bound and focused on White middle-class males has expanded to take into consideration gender, nation, region, age, ethnicity, sexuality, ability, and

class. Furthermore, as both Downing (2003) and Castells (2010) remind us, we must not forget the importance of religion in the contemporary world, as many armed conflicts revolve around religion, and media content, production, audiences, and effects are interlaced with religious impulses.

Media studies is an interdiscipline. As such it draws on and benefits from a number of contributing fields such as history, philosophy, psychology, political science, education, literature, and sociology. Yet even as it draws on those many fields, it is its own area of studies. Too often other fields, whose interdisciplinarity takes them into media studies, see this interdiscipline as new – as in, “oh look, we just discovered that we ought to look at media.” Our field becomes the direct object of other scholars’ deployment of the myth of discovery. Just like Columbus discovered “America,”¹ scholars from other fields continue to “discover” media and media studies. A century’s worth of theories and research disappears in the process, and many of us often find ourselves in other disciplines’ conferences listening to presentations that implicitly suggest direct effects, transparency, mimetic images, and so on. Transparency, when media content, industries, audiences, and practices are treated as if they spoke for themselves, as if there were no mediation, is often the tactic taken by scholars outside our discipline. What we as a field contribute to the understanding of culture and society is, at the very least, that mediation is complex and that understanding mediation helps us to uncover patterns of power, distribution, and potential justice. Media studies is about unearthing and maximizing the democratic potential of practices, institutions, technologies, and audiences that pervade our contemporary life.

Nonetheless, as Gates reminds us in her introduction to Volume 6, one central question for both the present and future of media studies concerns the very definition of media: What counts as media now that it no longer makes sense to limit the term to film, television, audio, and print? Does it still make sense to refer to a broad concept or category of “media”? If the more appropriate terms are “digital media” or “new media,” then what do *these* terms encompass? Terms like “convergence,” “remediation,” “interactivity,” and “user-generated media” capture a general sense of current transformations, but what are some productive ways of parsing out the complex dimensions and issues that these terms encompass? By paying careful attention to issues of history and context, this encyclopedia seeks to trouble the usage of these terms even as they are used rather carelessly in popular culture and public policy.

The six separate volumes of this encyclopedia were present as six separate sections in *A Companion to Media Studies* (Blackwell, 2003), the volume that provides the model for this encyclopedia and that was, in turn, modeled after McQuail’s *Mass Communication Theory*. The editors of the individual volumes put together a stellar cast of authors who in turn produced original chapters. All volume editors were asked, indeed implored, to compose a table of contents that was inclusive in many ways. First, inclusivity in terms of global topics was paramount, and we strived for inclusivity in terms of authors and global regions as well. This, as I have discussed elsewhere (Valdivia, 2011b), is not as easy as it sounds. Differential access to the latest research, culturally different approaches to writing and developing an argument, resources that

might enable a given scholar or team to develop a project and get it ready for publication, and so on, are all variables that effectively discriminate in favor of those of us in well-funded research universities in wealthy countries. We recruited some scholars whose work we translated into English, and all editors worked assiduously to cast as global a network as possible.

Another element of inclusivity was paradigm diversity. Schooled at the Institute of Communications Research (ICR) at the University of Illinois, I am the recipient of an educational tradition that highly values paradigm inclusivity. Insofar as it was possible, we included scholars using quantitative and qualitative approaches, sometimes both of them at the same time. Obviously the *Media Effects/Media Psychology* volume focused solely on the social scientific tradition, while both the *Content and Representation* and *Audience and Interpretation* volumes included scholarship using both approaches. A third element of inclusivity was gender, race, and sexuality diversity. Cutting across as a focus that can be conducted in the research included in any of the six volumes of this project is the work of transnational feminism and globalizing gender studies (Hegde, 2006). Editors sought scholarship that would include these vectors of difference, as media studies really makes no sense without their consideration. Yet even within each of these categories we encounter new gaps that merit more research. For example, as Mazzarella mentions in the introduction to Volume 3: “the reader might notice that the volume is heavy with studies of cultural representations of females. Indeed, seven chapters deal with some aspect of this topic, while only one deals with masculinity. Yet this is representative of the field, as studies of media portrayals of women and girls have been very prolific, and media studies scholars have only recently begun to seriously study mediated portrayals of masculinity(ies) (Mazzarella, 2008).” The rise of masculinity studies follows feminist studies as a logical move once we realize that femininity is socially constructed. Indeed, this is a process that this collection of volumes entices us to accomplish: a greater degree of preciseness to this complex concept of media studies, which all of us who work within the interdiscipline intellectually seek to explicate.

As a final note about process, these volumes have been peer reviewed in an innovative manner for an edited collection. First, each table of contents was submitted to the peer review of a senior scholar within that area of the field and edited accordingly. Then, as the chapters came in, within each volume authors reviewed other chapters. Ideally, each chapter was reviewed by two other authors as well as by its editors. As the overall editor of the project, I carefully reviewed all volume editor introductory chapters. Now the review process is turned over to you, the reader.

Media Studies Today

As an organizing principle for this book, I have followed since 2003 the structure provided by many different editions of Denis McQuail’s *Mass Communication Theory*:

An Introduction. Dating back to the first edition in 1983 and up to the sixth edition in 2010, whose name has changed, appropriately enough, to McQuail's *Mass Communication Theory*, Denis McQuail provided a manageable way of dividing up the field into components that, while overlapping – as they had to be since these components were teased out more for scholarly inquiry than because they are discrete and differentiated – provided a useful way to look at the breadth of study of the media. We all experience media as an integrated experience. Media inherit values and histories that are in turn explicitly or implicitly incorporated into their production; then we either consume and/or interpret media in relation to regimes of representation, with particular audiences and interpretive tactics in mind, with some desired effects over which we have little control, and contributing to a future that – like effects – we wish we could influence but really cannot. Still for the purposes of research, we tease out the media experience into a number of areas.

The volumes of this encyclopedia match the sections of the *Companion*, which used McQuail's schema and added the “futures” section. Thus we have history, production, content and representation, audience and interpretation, media effects/media psychology, and futures. We will later add a “methods” volume to complete the encyclopedia. While these areas are teased out for the purposes of research, there is great cross-pollination by scholars in media studies. We find that some scholars use both qualitative and quantitative methodologies, or at least rely on both. We also find that many scholars write about two or more of the six areas mentioned above. In fact, many of the major trends in current research encompass holistic media studies approaches. Among these contemporarily salient research projects are network analysis (e.g., Castells, 2009, 2010; Chan, 2007, 2011, forthcoming; Gilbert, Karahalios, & Sandvig, 2010); girl studies (Banet-Weiser, 2011; Durham, 2004; Projansky, 2007a, 2007b, 2010; Valdivia, 2008, 2009, 2011a); transnational feminism (Hegde, 2006; Molina Guzmán, 2010; Valdivia, 2011b); and neoliberalism as an undergirding framework of analysis (Banet-Weiser, 2011; Hay, 2000, 2010, 2011; Hoerl & Kelly, 2010; McCarthy, Pitton, Kim, & Monge, 2009). McCarthy (2011) expands the focus of neoliberalism in media to the educational system and the efforts of many cities, such as Chicago, to become a cosmopolitan, globally vibrant center of economic activity, thus linking media studies to educational policy studies.

Many of these recent research tendencies converge in the critical examination of the “posts.” Scholars develop amazing analyses demonstrating the potential of an intersectional approach that uses race, ethnicity, gender, ability, sexuality, and class all at once, for people experience these elements in an integrated manner. Roopali Mukherjee's *The Racial Order of Things* (2006) set the bar for intersectional analysis of the “post-soul” era. Tasker and Negra (2007) provide a comprehensive introduction to the political implications of postfeminist culture, while Molina Guzmán and Valdivia (2004) apply the intersectional approach to the study of celebrity Latinas. Joseph (2010), in her provocatively entitled “Tyra Banks is Fat!” (a title that, to be fair, comes straight out of tabloid magazines and television coverage), explores the implicit racism and sexism of the postracial and postfeminist veneer of reality television

in general, and Tyra Banks's brand in particular. Molina Guzmán (2010) explores the transnational deployment and commodification of the Latina body, both spectacular and everyday. The politics of the post appears in all elements of media studies as these scholars foreground media studies even as they situate their work within a broader context of geopolitics and the dynamically changing mediascapes. While it may be fashionable to suggest the end of media studies, just as others have previously declared the end of history or of ideology, what this encyclopedia convincingly illustrates is the field's ability to expand as new practices, technologies, and institutions arise. As many of the editors and contributors will document, "new media" is a misnomer as neither the technology nor the uses or assemblages are so new (see Morley, 2006). What at first may seem to be epochal breaks are revealed by many of the contributors to be far more continuous elements in relation to history, culture, and media.

Editors and Volumes

We begin with normative theories and history. **John Nerone**, author of *Violence Against the Press: Policing the Public Sphere in US History* (1994), co-author, with Kevin Barnhurst, of *The Form of News: A History* (2001), and co-author and editor of *Last Rights: Revisiting Four Theories of the Press* (1995), as well as author of many other journal articles and book chapters, is the perfect historian to lead us through this fertile terrain of scholarship. Volume 1 on history underscores that while all media have long histories, historians agree neither on the definitive tale of origin nor on the particular historical approach. Moreover, Nerone, the careful historian, alerts us to the fact that even our use of the word media in relation to communications is quite recent.

Nerone's volume includes normative and historical approaches. Historical research, drawing on normative frameworks or not, continues to offer media studies scholars great insight and tools with which to understand contemporary media. Furthermore, there is great diversity within historical approaches to media studies. Beyond cultural memory and special effects as components of media history, we are also witnessing an explosion of careful work that revisits the archive, data, and documentation. Kafka (2009) brilliantly studies that most elemental component of media – paper. It seems like such a simple task: how do we study the construction and use of paper, the "bureau" in bureaucratization, the work of scribes? Kafka concludes that: "As scholars continue to research the history of paperwork, we need to keep in mind that we are defending not only the 'historical record,' but the political one" (2009, p. 352). Indeed, these are the perfect words to keep in mind as we read the volume on history so elegantly crafted by John Nerone.

Volume 2, *Media Production*, is composed by **Vicki Mayer**. Among the many publications by Mayer, we can list *Below the Line: Producers and Production Studies in the New*

Television Economy (2011), *Producing Dreams, Consuming Youth: Mexican Americans and Mass Media* (2003), and *Production Studies: Cultural Studies of Media Industries* (co-edited with M. J. Banks and M. T. Caldwell, 2009). Mayer begins her volume by reminding us that “[M]edia production is frequently the most invisible aspect of our relationships with media. In the storm of media messages we encounter, we rarely consider where they came from, who made them, and how.” We expect to find, and we are not disappointed, a combination of keen attention paid to the sociological approach to our field, something about which McQuail had previously written in *Towards a Sociology of Mass Communications* (1969), and the more critical analysis of neo-Marxist political economy now accompanied by a focus on labor issues in the global setting. Moreover, as explicitly stated in one of her book titles, Mayer paradigmatically maintains a dialogue between political economy and cultural studies, an approach that resonates with globally used approaches in our field. The tension between structure and agency pervades this fine volume. Mayer remarks that “[I]f the focus on social structures has implicated the modern state in the study of media production, the focus on the agency that people exert over media production implicates the modern project to create enlightened subjects who can embody, perform, reflect on, and actually become media producers.” So the new production studies is global by necessity as transnational ownership and production of media industries cannot be denied; blends political economy and cultural studies; foregrounds issues of labor, both above and below the line; and takes up issues of networks, intellectual property, and subjectivity as producers are constructed in terms of categories of identity.

Sharon Mazzarella, a prolific scholar of issues of youth and the media, leads us through the wide world of “content and representation.” Author or editor of books including *Girl Wide Web 2.0: Revisiting Girls, the Internet, and the Negotiation of Identity* (2010), *20 Questions about Youth and Media* (2007), *Girl Wide Web: Girls, the Internet, and the Negotiation of Identity* (2005), and *Growing Up Girls: Popular Culture and the Construction of Identity* (2001), Mazzarella is a rigorously trained social scientist who also pursues qualitative research. As such she is the ideal editor for this volume, which is respectful of both of those methodological approaches. Indeed, for many a budding media studies scholar, content and representation provide the first point of entry, as these are the aspects of media that we experience most directly. Although, of course, all media have normative implications, histories, and a complex web of production, most people focus on the finished product: the television show, the movie, the blog, the social media website, the song, the newspaper, the advertisement, the catalogue. Content analysis is alluring yet amazingly difficult to carry out. Representational analysis also bears the sophistication of a range of theories. Neither is an easy task, and quantitative approaches complement interpretive studies. Mazzarella presents a persuasive argument as to why content/representational analysis remains an essential component of media studies and why projects that are well carried out tell us much about the world and the circuit of culture. Unsurprisingly, this area of research continues to be plentiful.

Radhika Parameswaran edits Volume 4 on audience and interpretation. Parameswaran’s research includes two long articles in *Journalism and Communication*

Monographs, “Melanin on the Margins: Advertising and the Cultural Politics of Fair/Light/White Beauty in India” (2009, co-authored with K. Cardoza) and “Global Media Events in India: Contests Over Beauty, Gender, and Nation” (2001). Her work has focused on the intersection of feminist cultural studies, gender and media globalization, South Asia, and postcolonial studies with a particular emphasis on issues of audience and interpretation. As such she constructs a volume worthy of her areas of expertise, with plenty of chapters illustrating global and gender issues. This volume also bears the traces of an interdisciplinary field that includes social scientific paradigms such as uses and gratifications as well as more humanist approaches that now include global and online ethnographies. Parameswaran remarks that “audience studies has not only survived the backlash against its populist tendencies in the late 1980s to mid-1990s, but it has also thrived and expanded to include a range of audiences, media genres, modes of audience engagement, and institutional and international sites of reception.” “Populist tendencies” refers to the “discovery” of the audience around every corner, as it were, without proper attention to issues of power and structure. In the contemporary moment, audience studies is vibrant and innovative. Whether we look at fans or online digital communities, to mention just two of the many possibilities, the construction and potential agency of the audience are major issues that continue to guide the production of media and subjectivities. Illustrative of the many philosophical quandaries undergirding the location of the audience within media studies is Jack Bratich’s chapter in Volume 6, as audience analysis is part of the present and future of the field. In addition, audience connects with issues of production as it undeniably takes labor to be part of any audience.

Erica Scharrer guides us through the fifth core component of media studies, media effects and media psychology, the dominant paradigm in the United States as well as in other global settings such as the Netherlands, and the paradigm that reaps the most funding in a positivist framework that values scientific demonstration of impact. Scharrer has co-authored, with G. Comstock, *Television: What’s On, Who’s Watching, and What it Means* (1999), *The Psychology of Media and Politics* (2005), and *Media and the American Child* (2007), and, with L. Weidman and K. Bissell, a long article in *Journalism and Communication Monographs*, “Pointing the Finger of Blame: News Media Coverage of Popular-Culture Culpability” (2003). Scharrer brings to the volume on media effects/media psychology a long-standing engagement with the social scientific paradigm in our field. A well-carried-out effects study tells us much about the influence of media on individuals, groups, and societies. The field of media effects, therefore, is presented with both the challenge and the opportunity to sort out these complex and potentially idiosyncratic experiences in a context in which the number of media outlets has proliferated, their use occurs at virtually any location and time of day, and their consumption and purposes intersect and converge more than ever before. Thus Scharrer asks: “Why are individuals drawn to media to such impressive degrees? How do they process and make meaning from media messages? What types of content are they both receiving and creating when spending

time with media? What are the consequences of such media use? What factors and conditions help explain why individuals vary in their responses to media? And what factors and conditions may moderate or mediate such responses?" These questions require complex methodological and theoretical expertise to answer. Many of us were schooled in a critique of the "hypodermic needle" model, though we have since learned that the media sometimes have or generate direct effects. Why else does a multibillion dollar advertising industry exist in the United States? However, we continue to marvel at the long-term cumulative effects that are far more complex than we originally anticipated. Furthermore, effects scholars, such as many of those contributing to Scharrer's volume, seek to explore how to effect positive change as well as how to avert more nefarious outcomes.

Finally for now,² the encyclopedia concludes with Volume 6 on media studies futures edited by **Kelly Gates**. Gates's own research is the veritable embodiment of a focus on futures. Author of *Our Biometric Future: Facial Recognition Technology and the Culture of Surveillance* (2011) as well as co-editor with Shoshana Magnet of *The New Media of Surveillance* (2009), Gates studies the discursive formation of the wishful deployment of recognition technology with an "almost gleeful futurism" that suggests "if only" the systems were in place, before 9/11, for instance, our present and future would be different, better, and so on.³ Futures is, by definition, a transient category, as within 10 years the content of this volume will be the stuff of the present, or maybe even the recent past. As Raymond Williams has written, we cannot anticipate what will be an emergent media form until it is *post facto*. The futures volume takes up some of the issues around Internet, gaming, social media, mobile telephone in a converged media form, biopolitics, and digitalization technologies such as biometric body scans. Gates asserts that media studies needs to take seriously the possibility that *radical uncertainty and contingency* are the only features that define where media are and where they are headed. All of the chapters in this volume could be retrofitted into the other five volumes. Yet together they compose a vision of the field as it moves forward, taking up issues that date back centuries, engaging them with theories and modes of media that only apparently represent new terrain.

This is the state of the art of media studies. It is a field where we know better than to use the term "new" media – for all media are somewhat new but also very old in many of their aspects. Scholars in this encyclopedia take us back to the production of paper even as they bring us up to the latest technologies, assemblages, and institutions that arise to mediate our world. Contributors to this encyclopedia share the belief not only that media studies is an academic exercise, but also that by engaging in this important area of studies we are somehow contributing to a more just vision of the world. As the separate volumes build on each other, whether we are engaged in media at any of their analytical nodes (production, content and representation, audience and interpretation, media effects/media psychology), we are simultaneously linked to its history and its future. As a diverse heterogeneous field that is global, interdisciplinary, intersectional, multi-methodological, I cannot imagine a more exciting and potentially liberatory academic enterprise to be involved with.

NOTES

- 1 In this introduction and whenever possible, this encyclopedia uses “America” to refer to a continent and “US” or “United States” to refer to the country, unless we are quoting from scholarship that uses “America” otherwise.
- 2 A *Methods* volume is projected to be released at a later date, edited by Fabienne Darling-Wolf.
- 3 Few people know that Gates submitted her dissertation proposal the day before 9/11. What to the committee seemed like futuristic queries became the very real present within a period of 24 hours.

Mapping the Psychology of Agenda Setting

I

Theories of/about Effects Maxwell McCombs
and Jae Kook Lee

ABSTRACT

In the decades since the seminal Chapel Hill study, agenda setting has evolved into a broad theory and set of hypotheses encompassing five theoretical areas. Characterized by two major trends, all five of these areas remain active research arenas. There is a *centrifugal trend*, the expansion into new domains and settings far beyond the original realm of public issues. Their counterpoint is a *centripetal trend* in which scholars have turned their attention inward to further explication of the theory's basic concepts. Much of this work concentrates on the psychology of the agenda-setting process. This chapter examines the role of incidental learning and of moderator and mediating variables in the agenda-setting process, and the impact of agenda-setting effects at both the first and second level on the formation of attitudes and opinions and on subsequent behavior.

Classic Conceptualizations and Emerging Trends

The media lay the foundations of public opinion through their substantial influence on the topics at the center of public attention. This agenda-setting role of the media, its influence on what the public comes to regard as the most important topics of the

day, has its intellectual origins in Walter Lippmann's *Public Opinion* (1922). His thesis that the news media are the bridge between the vast world of public affairs and each citizen's limited perspective of that world was empirically tested by McCombs and Shaw (1972) during the 1968 US presidential election. In the decades since their tightly focused media effects study in Chapel Hill, North Carolina, agenda setting has evolved into a broad theory of communication and set of hypotheses encompassing five theoretical areas.

Characterized by two major trends, all five of these areas remain vigorous research arenas today. There is a *centrifugal trend*, the expansion of agenda-setting research into new domains and settings far beyond the original realm of public issues. This includes such disparate areas as professional sports (Fortunato, 2001), corporate reputations (Meijer & Kleinnijenhuis, 2006), classroom teaching (Rodriguez, 2004), and religious practice (Hellinger & Rashi, 2009). Their counterpoint is a *centripetal trend* in which scholars have turned their attention inward to the continuing explication of the theory's basic concepts. Much of this work concentrates on the psychology of the agenda-setting process, which is the primary focus here. After a brief overview of all five areas of agenda setting, this chapter will examine the role of incidental learning and of moderator and mediating variables in the agenda-setting process, and the impact of agenda-setting effects at both the first and second level on the formation of attitudes and opinions and on subsequent behavior.

An Overview

In their seminal study, McCombs and Shaw (1972) compared the pattern of issue coverage in the news media used by voters in Chapel Hill, North Carolina, with the list of issues that these voters considered the most important ones of the day. The media agenda of issues can be precisely described by rank-ordering those issues according to the amount of news coverage that they receive. In similar fashion, the public agenda of issues can be precisely described by rank-ordering the same issues according to the proportion of the public that regards each of these as the most important issue of the day. The high correlation found in Chapel Hill between the news media's issue agenda and the public's issue agenda supported McCombs and Shaw's theoretical proposition regarding the transfer of issue salience from the media agenda to the public agenda. In the decades since the Chapel Hill study, this basic agenda-setting effect – the influence of the media agenda on the public agenda – has been widely replicated in election and non-election settings for a vast array of issues worldwide and with a wide variety of study designs at both the macro and individual level (McCombs, 2004, pp. 30–32).

The 1972 Charlotte presidential election study (Shaw & McCombs, 1977) introduced a second area of agenda-setting theory, the elaboration of contingent conditions that moderate the strength of agenda-setting effects. Although Wanta and

Ghanem's (2000) meta-analysis of 90 studies from a wide range of settings found a mean correlation of +.53 with a relatively small variance, there are findings falling well outside this range. For example, Eaton's (1989) individual analysis of 11 issues found correlations between the media and public agendas ranging from $-.44$ for morality to $+.87$ for government performance. The median was $+.45$ for poverty. Foremost among the contingent conditions explaining these variations is the psychological concept of need for orientation (Weaver, 1977), which will be discussed in detail later in this chapter.

The 1972 Charlotte study also introduced the concept of a second level of agenda-setting effects, attribute agenda setting. In theoretical terms, the Chapel Hill study examined basic agenda-setting effects, the transfer of object salience from the media to the public. *Object* is used here with the same meaning as the term *attitude object* is used in social psychology. For each object on the media agenda or the public agenda, an agenda of attributes can also be identified. This agenda is the hierarchy of attributes describing the object. For example, during the early months of the US presidential election, the news media present an agenda of candidates. The salience of these objects among the public reflects basic agenda-setting effects. The news media also describe these candidates, telling us about some of their attributes. Just as the rank-order of objects on the media and public agendas are compared to measure basic agenda-setting effects, the rank-order of attributes on the media and public agendas are compared to measure attribute agenda setting, the third area of agenda-setting theory (McCombs, Lopez-Escobar, & Llamas, 2000; Weaver, Graber, McCombs, & Eyal, 1981).

The attributes of an object have both a substantive and affective dimension. Substantive attributes are the cognitive elements of messages that describe the denotative characteristics of an object. Examples of the substantive attributes of a political candidate are ideology and issue positions. For issues, substantive attributes include sub-areas – for example, unemployment and budget deficits as sub-areas of the economic problem – as well as such aspects of an issue as proposed solutions. The affective dimension is the positive, neutral, or negative tone in the descriptions of an object's attributes.

This core theoretical model of agenda setting described by first and second level agenda-setting effects and the contingent conditions moderating the strength of these effects has expanded in recent years to a fourth theoretical area describing the consequences of these effects for attitudes and opinions. All four of these areas will receive major attention in this chapter. A fifth area of agenda-setting theory, which is of less interest here, concerns the origins of the media agenda. This area links agenda setting to another field of mass communication research, the sociology of news.

The tightly focused Chapel Hill definition of agenda setting as the influence of the news media on the salience of public issues among the public has evolved into a broad theoretical perspective defining agenda setting as the influence of major elements in media messages – numerous objects and their attributes – on the salience of these elements among the public. We now turn to the centripetal trend in

contemporary research explicating the psychology of this agenda-setting process: the role of incidental learning and of moderator and mediating variables in the agenda-setting process, and the impact of agenda-setting effects at both the first and second level on the formation of attitudes and opinions and on subsequent behavior.

Agenda-Setting Effects from Incidental Exposure

Learning from the media can be either intentional or incidental. While the acquisition of information from the media usually has been conceptualized as an active process, incidental exposure is a viable alternative route to becoming informed. Agenda setting, which involves the acquisition of information about the salience of objects and their attributes, also is possible through both routes, intentional exposure or incidental exposure. At times, people pay close attention to the messages of the media. At other times, attention to these messages is far more casual.

Incidental learning has been discussed under a wide variety of definitions – occurring with minimal conscious allocation of attention (Bettman, 1979), without intent to remember (Jenkins, 1933), and without learning instructions (Frensch, 1998). The exact term used also varies – “low involvement learning” (Krugman, 1965; Robertson, 1976), “spectator learning” (Posner, 1973), and “incidental learning” (McLaughlin, 1965). Despite these variations, all refer to a phenomenon of learning passively about the environment without any significant involvement and intent to learn.

Learning about public affairs is costly when individuals expend resources to actively search for information, argues Downs (1957). However, the public often receives information in the course of doing other things, situations which involve little or no information costs. Popkin (1994) noted that most of the information that citizens use when they vote is acquired as a by-product of activities routinely pursued in their daily lives.

Incidental learning about public affairs that is relevant to the acquisition of knowledge in general, as well as to specific agenda-setting effects, can occur in two different ways: (1) through reactions to interruptions and (2) through low levels of attention (Bettman, 1979). When someone encounters information that attracts his or her attention while doing something else, this interruption can result in becoming informed even though the individual did not actively seek out the information (Beales, Mazis, Salop, & Staelin, 1981). The impact of soft news on people’s learning about foreign affairs (Baum, 2002, 2003) is an example of this interruption effect, in that the political information intrudes or *interrupts* while viewers are seeking casual entertainment or relaxation.

People also can acquire information without being significantly involved. The effects of low attention and low involvement learning are especially relevant for television and online messages in comparison to newspapers. Neuman, Just, and Crigler (1992) found that television is a more powerful tool for people to learn about

low salience issues, suggesting learning with low involvement. Acar (2007) found that incidental exposure to text advertising above an online gaming screen made a difference in preference for the advertised product.

Taking a slightly different tack, Frensch (1998) proposed two conditions under which implicit learning can occur: effortlessness and ubiquity. The first condition, effortlessness, is equivalent to Downs' (1957) concept of expending minimal information cost to learn about public affairs. The second condition, ubiquity, is related to the high level of redundancy across news media on the major issues of the day, so that even low levels of exposure are likely to create an awareness of these issues.

For example, people in northern New Jersey were more aware of candidates in a neighboring New York City election than were those in southern New Jersey, though most residents of New Jersey had no interest in the New York City elections (Zukin & Snyder, 1984). Northern New Jersey is in the same broadcasting market as New York City, so that people in the area were exposed to New York election news, regardless of their interest in it.

Marketing research suggests that incidental learning can influence the consequences of first and second level agenda-setting effects for subsequent attitudes and opinions. Janiszewski (1993) found that consumers' attitudes toward products in advertisements were formed in the absence of any conscious processing of the information. After reading a student newspaper that had been manipulated for the study, subjects in the treatment group had higher scores than those in a control group in a series of questions asking about their impressions of the products.

Although considerable evidence suggests that incidental exposure can contribute to awareness about many items, few studies have specifically investigated agenda-setting effects resulting from incidental exposure. One explanation for the paucity of research is methodological. Due to the nature of incidental exposure, it is extremely difficult in survey research to measure whether or how much people are incidentally exposed to messages in the media. However, a recent experimental study demonstrated that individuals incidentally exposed to a public issue were more likely to regard the issue as important than those not exposed to the issue (Lee, 2009). Three groups were incidentally exposed to news stories about the environment, while a control group was not exposed to the stories. The degree and nature of the incidental exposure was manipulated by specific instructions about the task, which was evaluating the usefulness of a college website designed for a general audience. One group only was instructed to navigate the website in order to evaluate its usefulness. Another group was instructed to move the cursor and hover over, but not to click on, banner ads leading to the web pages with the news stories, while the third group was instructed to click on the ads and then read the news stories for 10 seconds. Subjects in the third group, which was directed to pay some attention, but a very minimal level of attention, to the news stories about the environment, had significantly higher scores on the perceived importance of that issue than any of the other groups.

Incidental exposure is the lowest level of attention to media messages, but even this minimal exposure can have significant consequences. We swim in a vast sea of news,

absorbing news and information about the world around us through a continuous process of civic osmosis. There is abundant empirical evidence from the earliest days of our field about this learning from an array of media sources rather than a few distinct sources (Lazarsfeld, Berelson, & Gaudet, 1944, p. 122; McCombs et al., 2000, Table 4; Stromback & Kioussis, 2010). In the contemporary setting, Coleman and McCombs (2007) found that although younger adults are not exposed to traditional media as frequently as older generations and use the Internet significantly more, the agenda-setting effects of newspapers and TV news are highly similar across generations. This process of civic osmosis also is buttressed by the finding that the strength of agenda-setting effects are not monotonic with increasing levels of exposure, but frequently reach asymptote after moderate levels of exposure (McCombs, 2004, Box 5.2). The pervasiveness of these patterns of exposure also explains why many agenda-setting research designs do not explicitly measure individuals' level of media use.

Although some minimal level of accessibility is necessary for agenda-setting effects to occur as a consequence of exposure, individual differences regarding the applicability of the information also must be considered.

When people identify, interpret or, more generally, respond to a stimulus, what knowledge will be activated and used in their response? In answering this question, accessibility and applicability have been described as two distinct sources of knowledge activation, with salience contributing to knowledge activation through its influence on applicability. (Higgins, 1996, p. 164)

Wanta (1997) and Price and Tewksbury (1997) specifically linked the knowledge activation model to basic agenda-setting effects, evaluative responses by members of the public that a particular issue is an important problem facing the country. Other agenda-setting effects, the salience of various objects and attributes among members of the public, involve similar evaluative judgments.

Need for Orientation

Weaver (1977) introduced the psychological concept of need for orientation to agenda-setting theory in the 1972 Charlotte study of the US presidential campaign. In the civic arena, there are many situations where citizens feel a need for orientation. For example, in primary elections to select a party's nominee for office, there sometimes are as many as a dozen, largely unfamiliar candidates. Because it is a primary election, one orientating cue frequently used by voters, party affiliation, is moot. In these circumstances, voters frequently turn to the news media for orientation. Not every voter feels this need for orientation to the same degree, of course. Some citizens desire considerable information before making their voting decision. Others desire no more than a simple orienting cue. These individual differences in the desire

for orienting cues and information explain differences in attention to the media agenda and differences in the degree to which individuals accept the media agenda.

Conceptually, an individual's need for orientation is defined in terms of two lower-order concepts, relevance and uncertainty. Relevance is the initial necessary condition. Individuals have little or no need for orientation in numerous situations in the realm of public affairs because these situations are not perceived to be relevant. In these circumstances, the need for orientation is low or even nonexistent.

Among individuals who perceive the relevance of a topic to be high – to keep matters simple, relevance is dichotomized here as either low or high – the level of uncertainty about the topic must be considered. Sometimes individuals already have all the information they desire, and their degree of uncertainty is low. In this circumstance, people usually do not ignore the news media, but they primarily monitor the news in order to detect any significant changes in the situation at hand. Under these conditions of high relevance, but low uncertainty, the need for orientation is moderate. At other times, such as primary elections, both relevance and uncertainty are high. These circumstances define a high need for orientation.

The greater an individual's need for orientation, the more likely they are to reflect the issue agenda of the media. Figure 1.1 outlines the concept of need for orientation and reports the level of agenda-setting effects found amongst Charlotte voters during the 1972 US presidential election. During the summer months as the campaign took shape and, again during the fall campaign, agenda-setting effects increased monotonically with the strength of the need for orientation. This same monotonic pattern also was found in a Japanese mayoral election (Takeshita, 1993) and in many other settings subsequently.

As noted earlier, the core idea of agenda setting refers to the ability of the news media to focus public attention on a few key objects and on the dominant attributes of those objects. These attributes have two dimensions. Substantive attributes refer to specific components of an object, and affective attributes refer to evaluations of the components.

<u>RELEVANCE</u>		NEED FOR ORIENTATION	AGENDA-SETTING EFFECTS		
			US (Charlotte) June October		Japan
Low	-----	LOW	+ .15	+ .29	+ .39
<u>UNCERTAINTY</u>					
	Low -----	MODERATE	+ .35	+ .59	+ .62
High	-----				
	High -----	HIGH	+ .41	+ .68	+ .86

Figure 1.1 Need for orientation and agenda-setting effects.

In accordance with these core concepts of agenda-setting theory, Matthes (2006) developed three sets of measures of the need for orientation. Corresponding to the first level of agenda setting, there is a measure of need for orientation toward the object itself. For example, an individual may believe “it is important for me to observe this issue constantly.” Two additional measures examine need for orientation to specific aspects of an object. These measures take into account the second level of agenda setting, specifically, the substantive attributes of the object under consideration, “I would like to be thoroughly informed about specific details,” and the affective attributes of the object, specifically the journalistic evaluations found in commentaries and editorials, “I attach great importance to commentaries on this topic.”

Matthes (2006, 2008) found that these three sets of measures are highly correlated (the correlations range from $+0.70$ to $+0.88$), and their scores can be summed to create a single need for orientation (NFO) score for each individual. In an investigation of the issue of unemployment in Germany, Matthes (2008) found that the strength of NFO measured by this composite scale predicted basic first-level agenda-setting effects. However, the strength of NFO measured by the composite scale did not predict media effects at the second level of agenda setting, specifically, the affective attribute of the unemployment issue.

Chernov, Valenzuela, and McCombs (2009) examined the comparative strength of the traditional NFO measures and these new NFO measures in predicting agenda-setting effects among participants in a controlled experiment. Both sets of measures independently predicted first-level agenda-setting effects. The comparative strength of the two measures was examined in a series of multiple regressions. When the traditional NFO scale and the new summary NFO scale were entered simultaneously, the traditional NFO scale was the stronger predictor. Further analyses identified the first sub-dimension of the new NFO scale, the sub-dimension directly concerned with first-level agenda setting, as a stronger predictor than either the total scale or the other two dimensions. Finally, comparison of the traditional NFO scale with the first sub-dimension of the new NFO scale indicated that the traditional scale is slightly stronger.

Which is the preferred measure? Where they differ is their focus of attention. For the traditional NFO scale, the focus of attention is the news in general about a particular topic. For the three components of NFO introduced by Matthes, the attention is on aspects of the news that can be investigated as three specific focal points in the evaluation of relevance.

Elaborating the Concept of Relevance

Agenda setting is not a contemporary version of the massive media effects theories, such as the bullet theory or hypodermic model, that were popular in the early days of mass communication research. The media can stimulate agenda-setting effects,

but the magnitude of these effects is moderated by a variety of individual differences. Among these moderators, the accumulated evidence regarding need for orientation suggests that in particular a key moderator variable is relevance. Although uncertainty also defines NFO, it plays only a secondary role of distinguishing between moderate and high NFO for persons considering a topic relevant.

Over the years the relevance of public issues and other objects has been examined from a variety of perspectives, and closer attention to these studies in this review revealed the theoretical gestalt diagrammed in Figure 1.2. Explicating the dimensions of relevance, Evatt and Ghanem's (2001) analysis of the public's response to eight different issues on a set of 13 semantic differential scales identified two substantive

Figure 1.2 A theoretical gestalt: the psychology of relevance and agenda-setting effects.

aspects of issue salience, social relevance and personal relevance, and an affective aspect of issue salience, emotional relevance. Bouza (2004, p. 250) made a similar theoretical distinction to identify the *impact area* of political communication:

individuals maintain an important area of personal interests that is separated, to a certain degree, from what that individual considers to be public interests or everyone's interests . . . This clear distinction between an area of personal interests and another area of public interests makes the existence of an area that I will define as the impact area of political communications possible . . . because it is the area in which the individual feels a clear coincidence between the country and himself . . .

Approaching the concept of relevance from a different perspective, a pair of statewide polls in Texas explored why respondents named a particular issue in response to the widely used Gallup MIP question, "What is the most important problem facing this country today?" (McCombs, 1999). Using a set of questions developed to probe the personal resonance of an issue, analysis of these polls from 1992 and 1996 identified a stable set of five sources of issue relevance: self-interest, avocation, civic duty, peer influence, and emotional arousal. As Figure 1.2 indicates, these five motivations dovetail with Evatt and Ghanem's distinction between personal salience, social salience and emotional salience.

Focusing on emotional salience in *The Political Brain*, Drew Westen (2007, p. ix) declared that "the vision of mind that has captured the imagination of philosophers, cognitive scientists, economists, and political scientists since the eighteenth century – a *dispassionate mind* that makes decisions by weighing the evidence and reasoning to the most valid conclusions – bears no relation to how the mind and brain actually work." And in an agenda-setting experiment, Miller (2007) found that emotional responses to the news mediated agenda-setting effects, specifically when exposure to news stories was about the issue of crime, resulted in participants feeling sad or afraid. Although these two specific emotional responses mediated the relationship between the media agenda and the public agenda, other emotional responses did not result in a greater likelihood of regarding crime as an important problem facing the nation. Altogether the experiment measured the extent to which participants felt angry, proud, hopeful, and happy as well as sad and afraid while reading news stories about crime. Only feelings of being sad or afraid mediated the agenda-setting effect. Neither a general measure of emotional arousal nor a general measure of valence created from combinations of all six emotional responses explained the link between exposure to crime news and naming crime as an important issue facing the nation. However, the creation of negative valence did result in a greater likelihood of naming crime.

These findings are an opening gambit for agenda-setting research linked with the investigation of affective intelligence, an emerging area mapping the broad role of emotions across a wide range of political behavior that complements a rational person model of human behavior with an emotional person model of

human behavior (Marcus, Neuman, & MacKuen, 2000; Neuman, Marcus, Crigler, & MacKuen, 2007).

Coleman and Wu (2010) introduced a further theoretical distinction between two components of affective attributes: affect as emotion and affect as cognitive evaluations in terms of positive and negative. Details of their empirical results are presented below in the discussion of the affective impact of visual information. Here the research question is how these distinctions might clarify the concept of compelling arguments and previous research on emotional salience.

Certain characteristics of an object of attention may resonate with the public in such a way that these attributes become compelling arguments for the salience of the issue, person or topic under consideration. Ghanem (1997) found that not only did intensive crime coverage in the news generate high levels of public concern about crime as the most important problem facing the country (first-level agenda setting), but that an attribute of these crimes in the news – their psychological distance operationalized by drive-by shootings and local crime – influenced the salience of crime on the public agenda. This attribute was a compelling argument for the salience of crime as a public issue.

A dramatically different example of a compelling argument was found during the 1990 German national election, where the salience of problems in the former East Germany significantly declined among voters despite intensive news coverage (Schoenbach & Semetko, 1992). In this case, the compelling argument was the positive tone of the news coverage on the issue of German integration, an attribute that reduced the salience of the issue on the public agenda. More recent studies of compelling arguments have documented the impact of negative tone in the news on the salience of the economy on the public agenda (Sheafer, 2007); the impact of candidate attributes in the news across five US presidential elections on the public salience of those candidates (Kiousis, 2005); and during the 2000 US presidential election the impact of positive and negative attributes of issues in Kerry political ads (but not Bush ads) on the salience of these same issues on the public agenda (Golan, Kiousis, & McDaniel, et al., 2007). Although all these studies illustrate that compelling attributes on one agenda can influence object salience on another agenda, systematic theoretical mapping of which attributes function as compelling arguments – and the discrete roles of substantive and affective attributes – remains understudied.

Probing more deeply into what defines the relevance of public issues for an individual, Valenzuela (2011) found that Inglehart's (1977, 1990) concept of materialist and post-materialist values is strongly related to agenda-setting effects. Using a content analysis of major daily newspapers across Canada and survey data from a nationally representative sample interviewed during the 2006 Canadian national election, Valenzuela found that at both the aggregate and individual levels there were stronger agenda-setting effects among persons with materialist values than among those with post-materialist values. At the aggregate level, the correlation between the media agenda and the public agenda was +.55 for materialists and +.35 for post-materialists. These findings are consistent with the media's more prominent coverage

of materialist issues such as the economy and crime relative to post-materialist issues such as the environment and political reform. Further analysis at the individual level used an index of post-materialist values to predict susceptibility to agenda setting (Wanta, 1997). Controlling for demographics and political involvement, people with materialist values were more susceptible to the influence of a media agenda dominated by materialist issues than people with post-materialist values.

This theoretical gestalt defined by a half dozen previously scattered studies shows considerable promise for explicating the long-standing concept of relevance in agenda-setting theory.

Knowledge Activation and Agenda Setting

Both of the knowledge activation model's core concepts, applicability and accessibility, are pertinent to agenda-setting theory. Todorov's (2000) analysis of response patterns in survey research refers to applicability as the relevance of the larger context and specifically noted "the size of accessibility effects as a function of the applicability of knowledge activated by the initial questions" (p. 430). He further noted that "applicability constrains accessibility effects – a highly accessible concept may not be applied when it doesn't share any relevant features with the stimulus" (p. 431).

In contrast, Price and Tewksbury (1997) and Kim, Scheufele, and Shanahan (2002) argued that agenda-setting effects can be explained on the basis of accessibility alone and framing effects on the basis of applicability (see Chapter 3, this volume). However, the research on need for orientation demonstrates that the salience of issues on the public agenda involves more than the accessibility of those issues as a consequence of the frequency with which they have appeared in the news. The perceived importance to an individual of an issue presented by the media is significantly moderated by that individual's perception of the issue's relevance, which is the core defining concept of need for orientation.

One of the few attempts to empirically distinguish accessibility and perceived importance is Nelson, Clawson, and Oxley's (1997) experiment comparing the effects of TV news stories that presented two different attributes of a highly publicized KKK rally, free speech versus public order. Nelson et al. concluded:

Media framing of the KKK controversy significantly affected tolerance for the group, and this effect came about primarily because the two frames stressed the relevance or importance of different values (free speech versus public order), not because the frames altered the cognitive accessibility of these values. (p. 574)

. . . Our results point to a more deliberative integration process, whereby participants consider the importance and relevance of each accessible idea. (p. 578)

Kim et al. (2002) focused specifically on the accessibility of six attributes of an urban development issue. Although the accessibility of these issue attributes increased

sharply with greater exposure to the local newspaper, the resulting attribute agendas among the public did not correspond to the attribute agenda presented in the news coverage.

There was, however, no apparent correspondence of salience of attributes between the media and their audience. Among both High and Medium Exposure respondents, *Increased Sales-Tax Revenues*, *Increased Potential for Flooding*, and *Increased Traffic*, which were emphasized in the media, were not more salient (accessible) than other attributes. Particularly, the *Increased Potential for Flooding* was in fact the least salient attribute among High Exposure and Medium Exposure respondents. (Kim et al., 2002, pp. 16–17)

What emerged was a very different media effect in which the *relative* amount of increased accessibility for the attributes among newspaper readers paralleled the media attribute agenda. These effects are different from the attribute agenda-setting effects based on direct comparisons of the media and public attribute agendas for various issues and public figures over the years (Benton & Frazier, 1976; Dussaillant, 2005; McCombs et al., 2000; Mikami, Takeshita, Nakada, & Kawabata, 1994; Weaver et al., 1981).

Testing the hypothesis that accessibility mediates the relationship between media exposure and agenda-setting effects, Miller (2007) reported two experiments using different operational definitions of accessibility that failed to find support for the hypothesis. The relevance of an item in the news is the operative factor in setting the agenda, with considerably more modest and mixed evidence for the role of cognitive accessibility.

Consequences for Attitudes and Opinions

Contemporary research is mapping the consequences of both first and second-level agenda-setting effects for attitudes and opinions, both the traditional focus in communication research on the direction of opinion – whether it is positive or negative – as well as the strength of opinion. The latter begins with the question of whether people have an opinion at all and subsequently considers the intensity of that opinion regardless of its direction.

Among the consequences of agenda-setting effects for the direction of opinion, priming is the most widely investigated. Priming is the influence of the news media on the criteria that people use to evaluate political figures and government policies. The agenda-setting effects of news coverage frequently result in the enhanced salience of an issue among the public, and this issue in turn becomes the criterion for evaluating a political figure or government policy. In other words, priming is an extension of the agenda-setting process (Iyengar & Simon, 1993; Scheufele, 2000).

In the classic laboratory experiments conducted by Iyengar and Kinder (1987), issues that received extensive TV news coverage were more salient (agenda-setting effects) and were more likely to influence evaluations of the president's performance (priming effects) among participants exposed to this news than among a control group. Priming effects also have been found in field studies. Heavy news coverage of the Iran-Contra scandal shortly after the 1986 election significantly influenced respondents' opinions about Ronald Reagan's performance as president. The weight of assistance to the Contras in evaluations of the president increased substantially after revelation of the scandal (Krosnick & Kinder, 1990). Research on priming beyond the US political context has demonstrated similar results. News coverage of political reform proposals announced by the last British governor of Hong Kong significantly influenced the weight that the public assigned to these proposals in their evaluation of the governor's performance (Willnat & Zhu, 1996). News coverage of various issues during the 1986 German election also primed preferences for the two major political parties (Brosius & Kepplinger, 1992).

Another source of influence on the direction of opinion is attribute priming. As illustrated in Figure 1.3, attribute priming is a consequence of attribute agenda-

Figure 1.3 Consequences of agenda-setting effects for opinions and behavior. Reprinted from M. McCombs (2004). *Setting the agenda*. Cambridge, UK: Polity.

setting effects, a process elaborating the broader concept of attitude and opinion change in which it is the increased salience among the public of specific attributes emphasized in news coverage that influences the weights people assign to those attributes in their evaluations of attitude objects.

This process of attribute priming frequently is a consequence of the affective tone of particularly salient attributes; that is, the degree to which salient attributes are perceived as positive or negative by the public. Sheafer (2007) refers to this influence as *affective attribute priming* and found significant evidence for this consequence of attribute agenda setting in his study of five Israeli elections. The more negative the media coverage of the economy, the lower were the evaluations of the general performance of the incumbent political party. Media coverage not only primed the economy as a criterion for judging the performance of the party in power, the affective tone of that coverage influenced the direction of the evaluations.

A study of state and federal elections in Texas combined both substantive and affective dimensions to examine the effects of attribute priming on people's opinions of the candidates for governor and US senator (Kim & McCombs, 2007). Significant relationships were found between the attribute agenda-setting effects of the news media and people's opinions of these four candidates. Additional analyses found that a greater number of the attributes describing the candidates' qualifications and character predicted individuals' opinions toward the candidates for heavy readers than for light readers.

Other evidence of a link between the affective attribute agenda and the direction of opinions was found in a comparison of Spanish citizens' ratings of six major political figures on an attitude scale with their descriptions of these men in response to an open-ended question used to elicit their attribute agendas (Lopez-Escobar, McCombs, & Tolsa, 2007). For these six public figures, the correlations between citizens' ratings and the overall tone of their affective attribute agenda ranged from $+ .78$ to $+ .97$. Low ratings were coupled with very negative descriptions, high ratings with very positive descriptions.

The consequences of agenda-setting effects also have been investigated for opinion formation and the strength of attitudes and opinions. Kioussis and McCombs (2004) found that the salience of 11 public figures in the news during the 1996 US presidential election was strongly correlated with the proportion of the public having an opinion about these persons, in particular, the strength of those opinions measured by both dispersion (holding a non-neutral opinion) and polarization (holding an extreme opinion). For dispersion, the median correlation was $+ .81$; for polarization, $+ .70$.

Evidence for a link between the public salience of issues and opinion strength also was documented by Rossler and Schenk (2000). The salience of two issues, German reunification and East German migrants, significantly predicted the strength of opinion on these two issues.

In accordance with the traditional sequence in hierarchy of effects models (McGuire, 1989), the prevailing view is that media salience influences public salience (an agenda-setting effect), which in turn affects the strength of opinion on the issue.

However, Kiouisis and McCombs (2004) found evidence for a transposed sequence of effects. Both opinion dispersion (holding a non-neutral attitude) and opinion polarization (holding an extreme attitude) mediated the relationship between the media salience and public salience of major public figures. In other words, media salience influenced having an opinion about a person, which in turn affected the public salience of that person. Though Kiouisis and McCombs raised an intriguing question about the order of the relationship between issue salience and attitude strength, nevertheless, their study provided strong evidence for a link between agenda setting and opinion formation.

For the budget deficit issue, Weaver (1991) documented significant relationships between issue salience and both opinion strength and the direction of opinion. As the salience of the deficit issue increased, opinion on the issue became stronger. Weaver (1991, p. 65) also noted the effects on the direction of opinion: "These findings tend to support Katz's (1980) conclusion that 'as a latent consequence of telling us what to think *about*, the agenda-setting effect can sometimes influence what we think' . . ."

Affective Impact of Visual Information

Although the television agenda, both at the first and second levels of agenda setting, is included in dozens of studies, nearly all of the television data reflects the text messages of TV news and political advertising. However, television is preeminently a visual medium of communication, and the lack of research examining its visual component has been a significant gap in our understanding of the agenda-setting role of the media.

Expanding second-level agenda setting to include the affective agenda of television news in its visual portrayals of presidential candidates, Coleman and Banning (2006) examined the national television news coverage of George Bush and Al Gore during the 2000 US presidential campaign. Their content analysis of the two candidates' nonverbal behavior – facial expressions, posture, and gestures – found more shots showing positive behavior by Gore than by Bush and more shots showing negative behavior by Bush than by Gore.

To determine whether these television images are related to the public's affective impressions of Bush and Gore, Coleman and Banning conducted a secondary analysis of the 2000 National Election Studies. One set of NES questions for each candidate asked if he had ever made the respondent feel "angry," "hopeful," "afraid," and "proud." Another set of questions asked respondents to what extent seven words and phrases described Bush and Gore. Two of these referred to negative character traits – "dishonest" and "out of touch with ordinary people", while five referred to positive character traits – "moral," "really cares about people like you," "knowledgeable," "provides strong leadership," and "intelligent." Scores on these questions were summed to form a positive and a negative affective attribute index for each candidate.

Comparisons of the positive and negative media agenda of attributes with the public's positive and negative agenda of attributes found modest evidence for the impact of visual messages. For Bush, there were significant correlations between the media and the public for both the positive and negative attribute agendas (+.13 for each). For Gore there was a significant correlation between the media and public only for the positive attribute agenda (+.20). Coleman and Banning (p. 321) note, "While the effect of nonverbal cues may be less than the effects reported for some verbal cues, the effect is nevertheless significant. . . . Visuals can play an important albeit modest role in facilitating impression formation in the political process."

Extending this analysis of affective agenda-setting effects from visuals, Coleman and Wu (2010) introduced the theoretical distinction noted earlier between affect as emotion and affect as cognitive evaluations in terms of positive and negative. No significant correlations were found between their measures of nonverbal behavior by Bush and Gore in the TV news shots with either the public's cognitive evaluations of the candidates' traits or the public's positive emotional responses to the candidates. Significant relationships were found between the content of the TV visuals and negative emotional responses (+.10 for Bush and +.12 for Kerry).

Political and Civic Participation

Beyond their impact on attitudes and opinions, agenda-setting effects have consequences for a wide scope of political and civic behavior. Discussion of politics, voting on election day, and donating money to political causes as well as more diffuse aspects of civic participation, such as membership in civic groups and community involvement, are linked to agenda-setting effects (Moon, 2008). There are consequences of first-level agenda-setting effects on issues from exposure to newspapers and television for both political participation and civic participation, consequences that are both direct as well as mediated by opinion strength. For second-level agenda-setting effects on the images of candidates, Moon found consequences for political participation from exposure to newspapers and television. The impact of agenda-setting effects on political participation was both direct as well as mediated by opinion strength. Exposure to the news and the resulting agenda-setting effects facilitate a wide range of political and civic participation.

Conclusion

Civic osmosis, the acquisition of information about public affairs often with little effort or close attention, results from the ubiquity and redundancy of the mass media. Among the significant by-products of these repetitive messages in the media are basic

agenda-setting effects and attribute agenda-setting effects. However, this media influence on the foundations of public opinion is tempered by individual differences among members of the public in the perceived relevance of these messages. A major contribution of this chapter is a theoretical gestalt elaborating the concept of relevance, which is the major theoretical component of need for orientation. This gestalt links a set of three perspectives on relevance – personal, social, and emotional – with the idea of compelling arguments and with individual attitudes defined by Inglehart's materialistic/post-materialistic values. This gestalt also further elaborates the emotional aspects of agenda setting. Beyond explicating the moderating and mediating variables in the psychology of agenda setting, this review also suggests new avenues of research into the consequences of agenda-setting effects for attitudes, opinions, and behavior. All of this will be productive for mapping agenda-setting effects in the expanding media landscape, a setting in which the broad effects of the traditional media and their new media counterparts are likely to co-exist with the tightly focused effects of niche media serving narrow and highly selective personal interests.

Agenda setting continues to offer an expanding array of new and theoretically important questions to be explored in all five areas of the theory. In the words of the famous fictional detective, Sherlock Holmes, "Come, Watson, come. The game is afoot."

Cultivation Theory

Television Fiction as a Vector of Socialization

Jan Van den Bulck

ABSTRACT

Cultivation theory was developed by George Gerbner of the Annenberg School for Communication and his colleagues in the late 1960s. The theory argues that by overemphasizing certain aspects of social reality (such as violent crime) and underrepresenting other aspects, television drama affects people's perceptions of reality. Even though it has attracted a lot of criticism, it is one of the three most generative theories in the field of communication research. In recent years much attention has focused on the study of psychological processes. This chapter argues that there are many challenges cultivation theory will face in the coming years. Both the fact that television viewing behavior is changing rapidly and the fact that only small relationships have been found need methodological attention. Developing a sociological theory of the long-term impact of television stories on culture and socialization may be the way forward.

George Gerbner and his colleagues of the Annenberg School for Communication started to develop the cultivation model of media effects in the late 1960s. In 1976 Gerbner and Gross, writing in the *Journal of Communication*, called the cultivation perspective a "new approach to research." By the time this article was published Gerbner and his team had been collecting and compiling data for nearly 10 years.

Gerbner based his theory on the observation that much socialization in society takes the form of what he called *storytelling*. Communities create stories to illustrate what their social order is, what their norms are and to make their members accept them as normal (Gerbner & Gross, 1976, p. 173). In their classic text on the sociology of knowledge, social constructivists Berger and Luckmann (1976) described how hunters in primitive societies socialized young members of the community by telling stories. Unlike Gerbner, Berger and Luckmann do not appear to have realized that the hunters do not have to talk about events that really took place (Van den Bulck, 1999, 2010). It suffices to invent a story, even a funny or mythical one, to show other members of the tribe what the norms are and what the penalties for transgressing them are. Societies thus use stories to offer their children “a coherent picture of what exists, what is important, what is relevant to what, and what is right” (Gerbner & Gross, 1976, p. 176).

By the time Gerbner and his colleagues launched their views it had become apparent that television had become the most important source of stories about the real world. Gerbner and his team noted how much violence there was in television stories. They argued that the violence was essential to telling the story. A much-quoted definition said that:

TV violence is a dramatic demonstration of power which communicates much about social norms and relationships, about goals and means, about winners and losers, about the risks of life and the price for transgressions of society’s rules. Violence laden drama shows who gets away with what, when, why, how and against whom. (Gerbner & Gross, 1976, p. 178)

Cultivation theory thus argued that violence is the vehicle stories use for illustrating norms and values.

While cultivation research is usually conducted by studying individuals, Gerbner set out to study societies within the much wider frame of what he called the *Cultural Indicators Project*. For this, he felt, three aspects of the role of stories in society needed to be studied (Gerbner, 1966, 1969). The first was *institutional process analysis*, which aimed to chart the power structures and societal processes that govern the production of media messages. The second was *message system analysis*. Quantitative content analyses were conducted to analyze the TV demography. It showed which groups were under- and overrepresented, which types of people tended to be victims and which people tended to be perpetrators of violence and crime. In a number of “violence profiles” (Gerbner & Gross, 1976; Gerbner, Gross, & Eleey, 1977a; Gerbner, Gross, & Signorielli, 1979), Gerbner and his associates calculated the prevalence of crime and violence and computed “risk ratios” that showed which groups in the TV world were more likely to be perpetrators and which were more likely to be victims of crime (Gerbner & Gross, 1976). The novelty of Gerbner’s approach is probably best captured by his contention that “‘Good guys’ were *of course* most likely to be the killers” (Gerbner & Gross, 1976, p. 190, *italics added*). While the idea of describ-

ing the positively depicted protagonist of a story as a killer must have been an unusual approach, it was perfectly logical from Gerbner's perspective. As explained earlier, violence was seen as a vehicle by which social norms and power structures in society were illustrated. By that logic the "good guy" has to kill because that is how the viewer knows what is approved by society and what is not.

The third element of the Cultural Indicators Project was called *cultivation analysis*. By using quantitative surveys Gerbner and his team assessed people's level of TV exposure and their perceptions of the world. Respondents were divided into heavy, medium, and light viewers and their answers on a number of questions were compared. There were several types of questions, including "Can most people be trusted?" or "During any given week, what are your chances of being involved in some type of violence?" (Gerbner & Gross, 1976, p. 192). Questions were devised using a forced-choice technique offering two answers, a "television answer" reflecting television reality or the television demography (suggesting that people were not to be trusted, that many men worked as detectives, etc.) and another answer that was closer to the real world. The percentage of light viewers giving the television answer was subtracted from the percentage of heavy viewers giving that answer and the resulting statistic was called the *cultivation differential*. This is the measure Gerbner originally used to illustrate the impact of television.

The first studies focused on perceptions of violence, victimization, and the number of people working in law enforcement (see Chapter 10, this volume). Later studies looked at other topics in a similar way, including gender roles (Signorielli, 1989; see Chapter 11, this volume), health (Gerbner, Morgan, & Signorielli, 1982; Signorielli, 1993), politics (Gerbner, Gross, & Morgan, 1982; Morgan & Shanahan, 1992) and so forth (for early overviews see: Signorielli, Gross, & Morgan, 1982; Signorielli & Morgan, 1990).

As the theory evolved two modifications were introduced. Some TV messages correspond with what viewers already think or believe. The most likely effect of television in those cases is *reinforcement*. The Gerbner team called this process *resonance* (Gerbner, Gross, & Morgan, 1980a, p. 15). The other refinement referred to what happens to subgroups with different (or even opposing) views and perceptions (conservatives versus liberals, men versus women, etc.). TV viewing offers members of different groups the same view of the world. Gerbner et al. (1980) believed this would lead to *mainstreaming*: because of their exposure to the same TV world view, heavy viewing members of subgroups would, in time, start to differ less from each other than the light viewing members of the same groups (Gerbner et al., 1980a, p. 15).

Early Criticism

The theory and methodology of Gerbner and his team's cultivation research attracted a lot of criticism. At times some of the criticism had the flavor of an ideological

debate. Even the television industry felt threatened enough to respond in academic journals (see, for instance, Blank, 1977; Gerbner, Gross, & Jackson-Beeck, 1977b).

The first type of criticism dealt with the statistical analyses of cultivation. Hughes (1980) reanalyzed the data from the National Opinion Resource Center (NORC) General Social Survey used by Gerbner and claimed that by introducing a number of control variables the relationships disappeared. The cultivation effect, he argued, was little more than a spurious relationship explained by third variables, a possibility entertained by a number of authors (Doob & Macdonald, 1979; Potter, 1988a; Tamborini, Zillmann, & Bryant, 1984; Weaver & Wakshlag, 1986). Hughes introduced an often quoted alternative explanation of the relationship between TV viewing and fear of violent crime. He argued that both fear and viewing volume were related to how much time people spent outside their homes. People who were more frightened were less likely to leave the house. People who spent more time at home were likely to watch more television. Being afraid would thus lead to watching more television, instead of the other way around (Hughes, 1980, p. 290; see Gerbner, Gross, & Morgan, 1980b for Gerbner's reply). Drawing on Cook, Kendzierski, and Thomas's (1983) argument that personal experience with crime or personality traits such as alienation or anomie (McLeod, Ward, & Tancill, 1965; Potter, 1988a) may make people afraid to leave the house, Van den Bulck (2004) called this the *withdrawal hypothesis*.

The most outspoken of the early attacks on cultivation theory came from Paul Hirsch (1980, 1981a, 1981b) who also reanalyzed some of Gerbner's findings. Gerbner and his team replied at length to Hirsch's comments (Gerbner, Gross, & Morgan, 1981a, 1981b). Hirsch argued that the cultivation hypothesis was unfalsifiable. He felt that this was especially true after the introduction of the *resonance* and *mainstreaming* concepts, as existing views were likely to appear either to be reinforced (*resonance*) or mitigated (*mainstreaming*). Hirsch felt that Gerbner et al.'s relationships were random fluctuations and argued that judgments and attitudes were likely to affect TV viewing rather than the other way around.

A closer look at Hirsch's criticism shows a fundamental flaw. Hirsch supported his ideas by comparing non-viewers with extremely heavy viewers. He noted elevated feelings of fear among the non-viewers, but not among the extreme viewers. According to Hirsch the "television answer" (higher levels of fear) should not have been found among non-viewers and should have been very prevalent among the heaviest viewers. The Gerbner team argued that it was "a little bit like trying to study religion by comparing atheists and fanatic fundamentalists" (Gerbner et al., 1981a).

Other critics felt that a quantitative content analysis was the wrong tool. "Content analysis, designed to measure manifest and quantifiable content [...] cannot satisfactorily reveal complex, connotative and ideological meanings" (Livingstone, 1990, p. 25). Counting violent acts gave every act the same weight and failed to take into account that the meaning of a violent act depended on the context. "The question for researchers is not how much violence might be available for personal involvement, but rather, what does violence mean to the respondent?" (Newcomb, 1978,

p. 274). Some have argued that this view required a semiotic approach to television content to show how television constructs meaning (Van Poecke, 1980, p. 428) but others pointed out that this would not make much difference as “a major problem with this kind of analysis is that it assumes that the messages defined by the analysis are the same as those absorbed by the audience” (Wober & Gunter, 1988, p. 13). McQuail (1994) labeled such approaches to media content and media effects “transmission models.” They are blamed for treating viewers as passive receivers (Neuman, Just, & Crigler, 1992, p. 16) who simply “reproduce” the meanings put into television messages by the producers (Wilson, 1993, p. 46). Qualitative and by now classic studies such as those by Morley (1980), Ang (1985), and Liebes and Katz (1990) argued that meaning is not constructed by television, but by the viewer. Newcomb therefore suggested that cultivation theory would benefit from an ethnography of the audience because “different members of the mass audience will attach different meanings to the same messages” (Newcomb, 1978, p. 280).

Can Cultivation Survive the Active Viewer?

Has effects research become trivial and meaningless as a result of the introduction of the active viewer model, as Livingstone (1993, p. 10) seemed to suggest?

Krippendorff (1993, p. 38) argued that it is no longer acceptable for effects researchers to assume that a media message has a single, measurable meaning. The same television program can have different meanings for different viewers. A murder in a televised movie can tell one viewer that the world is a dangerous and unpredictable place, while another viewer may believe that the story confirms the impression that criminals are generally less intelligent than the police. Wilson (1993, p. 46) remarked that a cognitive or semiotic distance exists between “text” and “reader.” This distance has to be bridged for any kind of communication to take place. Beck (1994, p. 38) therefore made a distinction between *data* and *information*. Technical appliances transmit data. When as a “cognitive system” (a person) receives and interprets the data they become *information*. What is stored by the viewer is the interpretation of the data, not the data themselves.

Although some claim that there are as many interpretations as there are viewers this is not what the founders of the active viewer model suggested (Buckingham, 1993; Dayan & Katz, 1992; Livingstone, 1993; Morley, 1980). Viewers cannot attribute just any meaning to a text. “Texts are not infinitely open and may allow a limited number of possible readings. Perhaps the *New York Times* can be read as pornography, but that is unlikely to be its statistically dominant use” (Blumler, Gurevitch, & Katz, 1985, p. 260). Texts (particularly in the mainstream of television) usually have “preferred readings” (Livingstone, 1990), which are the interpretations most likely to be evoked in average viewers. North American action drama might make some more fearful while suggesting to others that “good” always wins from “bad” and other

viewers may be entertained without taking away any message, but not many viewers will get the impression that mainstream television is supporting the belief that the world is becoming safer and that crime rates are decreasing.

Television messages offer boundaries within which different interpretations are possible. Interpretations that fall outside the boundaries (such as “the world is becoming safer”) are unlikely to be produced by the confrontation of the data and the viewer. Such a perspective sees television “as the embodiment of a system of *causal restraints*, of a network of boundaries restricting the range of available information, views and images, and *not* as an evil demon manipulating the viewers as if they were programmable robots or marionettes” (Seaman, 1992, p. 307). By limiting the range of interpretations supported by its messages television produces a *boundary-setting effect* (Van den Bulck, 2003) whereby only world views falling within the boundaries are reinforced. This is comparable to what Gerbner called the “mainstream pull” of television (Gerbner, Gross, & Morgan, 1994). When the boundaries within which interpretations are likely to occur become very narrow it may therefore be more appropriate to speak of a *data-setting* effect as very little interpretation is added to the televised data before it is stored as information.

Depending on the extent of “audience activity” or “cognitive processing” required from the observer, television messages can allow only a limited range of conclusions (*data-setting*) or a wider range allowing for “multiple readings” (*boundary-setting*) (Van den Bulck, 1996, 2003, 2010).

The Cognitive Revolution

In 1988 Berger and Chaffee (1988, p. 317) felt that communication and media research was entering a “golden age of cognition” that would see an integration of knowledge from cognitive psychology, interpersonal, and mass communication. A similar evolution could be observed among cultivation researchers, who had started to argue that finding effects (or, more accurately, relationships) did not suffice. The “how and why” of effects had to be explained as well (Shrum, 1995, p. 402). “Exposure to a communication is not a direct cause of social-reality decisions. Instead people must use various mental processes to interpret those communications and eventually to build a picture of the world. The influence of a communication must be mediated by these mental processes” (Shapiro, 1991, p. 3). According to some, cultivation was a label for a correlation rather than the explanation of an effect as long as there was no theory of how television fiction might affect viewers’ perceptions of reality (Hawkins & Pingree, 1990; Potter, 1993). Shapiro and Lang (1991, p. 686) even felt that the absence of a theory explaining the path from TV viewing to effect might lead to a considerable underestimation of the size of TV’s effects. What all of this meant was that “the perennial black box of mass media effects can be better illuminated by examining the black box of human information processing that goes on within it”

(Geiger & Newhagen, 1993, p. 42). The aim was high: Hawkins and Pingree (1990, p. 36) felt that calling media effects “learning processes” offered no explanation either – it just added one more label to the relationship.

The challenge was considerable. Beyond the age of 11 (Wright, Huston, & Truglio, 1995, p. 1707) most people recognize television fiction as being fictitious (Busselle & Greenberg, 2000; Potter, 1988b). They realize that television fiction does not show events that are actually happening in the real world. Any theory arguing that such fiction tells people something about the real world would therefore need to explain how this might work (Hawkins & Pingree, 1990, p. 36). It would have to go further than just offering an *implicit theory approach* (Roloﬀ & Berger, 1982, p. 17) that suggests that people “form impressions” about the world around them from all kinds of input.

First Order, Second Order, On-Line and Off-Line

Two distinctions have influenced a lot of thinking about the processes explaining cultivation effects: the distinction between first-order and second-order cultivation measures; and the distinction between on-line and off-line effects. Both distinctions have become intertwined.

The distinction between first- and second-order judgments was introduced by Hawkins and Pingree (1981, 1990). First-order judgments were “judgments related to the prevalence of particular constructs” (Shrum, Burroughs, & Rindfleisch, 2004, p. 183). They entailed estimates of frequencies and probability, such as the number of policemen; the proportion of the total workforce working as doctors; the divorce rate, and so on. For first-order estimates it is possible to make a distinction between a “television answer” (reflecting the television demography) and a “real world answer” (reflecting the demography of social reality). Second-order judgments referred to attitudes and beliefs (Hawkins & Pingree, 1981, 1990; Potter, 1991, 1993; Shrum, 1995). For second-order measures it is much more difficult to define what represents television’s view of the world and, even more so, what the real world answer is (Hawkins & Pingree, 1990, p. 49; Hawkins, Pingree, & Adler, 1987, p. 553; Shrum, 1995, p. 404). The Gerbner team has acknowledged the distinction (Gerbner, Gross, & Morgan, 1986) but Morgan and Shanahan (1997) remarked it was only useful when studying how cultivation works on a cognitive level. From the start it was assumed that television would affect first and second-order judgments differently (Hawkins & Pingree, 1982, 1990).

At first Hawkins and Pingree assumed that people store first-order judgments and use them to arrive at second-order judgments (Hawkins & Pingree, 1981; Shapiro, 1991; Shapiro & Lang, 1991). They expected first-order effects to occur as a result of accidental learning, made possible by low viewer involvement. “Second, the individual may use these bits of information to construct more general and integrated

conceptions of the world, and it is probably here that the 'higher' processes like inference or weighing television against other sources of information occurs" (Hawkins & Pingree, 1981, p. 358). Shrum and O'Guinn (1993, p. 438) called the first step the learning process and the second step the construction process. Such a relationship between first-order and second-order judgments is a common assumption. Social cognition theorists have remarked that

One might expect that judgments result from information stored in memory. People encode information about others, and when they need to make a judgment, they retrieve what they know and use it as a basis for judgment. If this process accurately characterizes what people do, then there ought to be a correlation between what people recall and their judgments. Attributions, evaluations, and other judgments seemingly ought to draw on the amount and organization of relevant data in memory. (Fiske & Taylor, 1991, p. 328)

To their surprise Hawkins and Pingree did not appear to find a relationship between first-order and second-order judgments (Hawkins & Pingree, 1990, p. 43; Hawkins et al., 1987, p. 575). They had to conclude that "the two types of beliefs seem to be independently influenced by viewed television content" (Hawkins & Pingree, 1990, p. 43).

L. J. Shrum argued that the puzzle could be solved by looking at the type of judgment first and second order referred to. He applied the views of Hastie and Park (1986) and Tversky and Kahneman (1973) about judgment formation. Hastie and Park (1986, p. 261) made a distinction between *memory-based* processes, in which people use memories to arrive at a judgment, and *on-line* processes, in which people form judgments in response to stimuli from the environment. On-line processing occurs when people make a judgment at the time of encoding, or, in other words, as a stimulus is presented or as events occur. Shrum argued that this is when second-order judgments are formed. While viewing, viewers process information and are influenced in their attitudes and beliefs. Shrum argued that first-order judgments (such as estimates of prevalence or set size) were memory processes. Shrum's *heuristic processing* (2002) or *accessibility* (2007) *model* argued that Tversky and Kahneman's (1973) *availability heuristic* explained first-order cultivation effects.

Kahneman and Tversky demonstrated that the ease with which people can recall (if they remember examples) or imagine (if relevant memories are not accessible) an event positively correlates with higher estimates of the prevalence of that event in the social world. Shrum argued that television fiction makes memories easier to recall or imagine. When people are asked to produce a first-order judgment (for instance, when answering survey questions) they make an estimate based on what they can think of most easily. If they are motivated to take the source into account they seem to realize (at least intuitively) that they are using memories of fictitious stories. "[T]he model implicitly assumes that if heuristic processing leads to the use of television information in the construction of prevalence estimates, and hence produces a cul-

tivation effect, then inducing people to avoid the use of a heuristic processing strategy should eliminate the cultivation effect" (Shrum, 1997, p. 350).

Shrum's ideas about memory-based television effects may make the cultivation effect look like an artifact. In his studies the impact of television does not occur until people try to answer survey questions. Memory-based processing of television images is, however, equally likely to occur in real life. Some crisis situations, for instance, require a quick judgment on probabilities and risk. Research on people's perceptions of the success rate of cardiopulmonary resuscitation (CPR) shows, first, that television fiction considerably overestimates the success rate of CPR (Diem, Lantos, & Tulskey, 1996) and, second, that heavy viewers of such fiction are likely to overestimate this success rate as well (Van den Bulck & Damiaans, 2004). In a medical emergency where people would have to make quick decisions regarding the effectiveness of CPR (for instance when deciding whether or not to sign a "do not resuscitate" form) the same kind of process (and television effect) may occur.

The Final Word on First- and Second-Order Processes?

The distinction between types of judgments (first vs. second order) and the time frame of the process producing the television effect (on-line vs. memory based) has done much to advance our understanding of cultivation, but it appears to have reduced the scope of research on cultivation as well. If we return to some old definitions cultivation effects should comprise more than the first- and second-order judgments and the presence of on-line and off-line (memory-based) processes may not be as clear cut either.

First, revisiting some of the definitions of cultivation suggests that there should be more than two types of measures that are indicators of a cultivation effect. Definitions of cultivation used by Gerbner's team are very broad. In their review of two decades of cultivation theory, Morgan and Shanahan, for instance, argue that the empirical strategy of cultivation research is to assess "the degree to which heavy viewers are more likely to give responses that are demonstrably emphasized in the television world" (Morgan & Shanahan, 1997, p. 11). This operationalization means that the validity of the cultivation hypothesis depends on empirical proof that "television viewing cultivates assumptions about the facts of life that reflect the medium's most recurrent portrayals" (p. 8). In another definition, Gerbner, Gross, and Morgan (2002) delineated cultivation effects as "the independent contributions television viewing makes to viewer conceptions of social reality" (p. 47). Most definitions of cultivation seem to focus on learning about reality by viewing television, with a special emphasis on the effects of fiction and "storytelling." All of this suggests that cultivation theory is a theory about the role of television fiction in the social

construction of reality: it occurs when television fiction affects people's image of the real world.

If this interpretation of the definition of cultivation is accepted, then first- and second-order measures do not cover the whole range of potential outcomes. First-order measures in particular appear to be part of a larger array of effects that can be referred to as social reality construction. Research on fear effects of crime fiction (Cantor, 2004; Custers, 2010a; Sparks, 1989) shows that exposure to television fiction can lead to social reality effects that are neither first nor second order. Affective effects should probably be studied as a third-order effect.

Second, the distinction between on-line and off-line processes may not be as straightforward as current research suggests. When the viewer undergoes a sudden change in views, as is the case when a "Drench" effect (Greenberg, 1988) or "sudden insight" (Potter, 1993) occurs, this is an on-line effect. Similarly, research on the "affect heuristic" (Slovic, Finucane, & Peters, 2007) and the "risk as feelings perspective" (Loewenstein, Weber, & Hsee, 2001) claims that changes in fear can lead to changes in risk perception. Experiencing fear is sometimes used as an indicator of risk, whereby people reason "I feel fear therefore the risk involved must be high." Since it has been well documented that TV viewing can elicit fear "on-line" (Cantor, 2004; Custers, 2010b), it is possible that people's perception of risk and similar probabilities may change on-line as well as off-line.

Challenges for Cultivation Theory in the Twenty-First Century: From a Psychological to a Sociological Revolution?

Cultivation theory is among the most often cited theories in media and communication research (Bryant & Cummins, 2007; Bryant & Miron, 2004). It has survived over 40 years of scrutiny and criticism. Will the theory and the study of this type of effect survive long enough to see the medium it studies celebrate its centennial? After all, the TV world is still a mean and violent place (Hetsroni, 2007; Signorielli, 2003; Smith, Nathanson, & Wilson, 2002).

To survive and to thrive cultivation theory will have to deal with a number of challenges.

(1) *The relationship between television exposure and cultivation measures is small.* A well-known meta-analysis by Shanahan and Morgan (1999) reviewed hundreds of cultivation studies and found an overall effect size of $r = .09$. Another meta-analysis (Dossche & Van den Bulck, 2010) found evidence of publication bias: small, underpowered studies tended to report higher correlations ($r = .12$) than adequately powered studies did ($r = .05$). In both cases, however, the results held under multiple

controls. A separate meta-analysis looked at (extremely rare) experimental cultivation studies (Dossche, 2010). The overall effect size was much bigger ($r = .16$), even though similar evidence of publication bias emerged with published underpowered studies (with $N < 100$) producing much larger relationships ($r = .26$) than adequately powered ones ($N \geq 100$ and up: $r = .15$).

If cultivation research is to develop further it will have to devote more attention to the issue of small effects sizes. Are they spurious relationships, as some have argued (Potter, 1988a; Tamborini et al., 1984); are they actually large relationships hidden by poor methodology (Geiger & Newhagen, 1993; Mulac & Kunkel, 1989; Potter, 1993) or do we need to make a distinction between the size of an effect and its importance, as, for instance Rosenthal (1986, p. 142) argued? A small effect on a large population may be extremely relevant in its consequences.

(2) *Cultivation research needs to start worrying about its exposure variable.* Remarkably little attention has been given to the exposure variable in cultivation research. Originally the Gerbner team argued that viewers “watch by the hour” (Signorielli, 1986) in which case measuring overall TV viewing sufficed: all who watch a lot of television are exposed to a very similar picture of the world. Some have argued that different genres may have different effects (Bilandzic & Busselle, 2008; Segrin & Nabi, 2002), but there appears to be little interest in going into more depth than that. It is remarkable to note how many different operationalizations of the television-viewing variable have been used, all implicitly claiming to measure the same thing. As a result the construct validity of the exposure variable is often fairly poor (see Allen, 1981; Salomon and Cohen, 1978 for old, but still relevant observations). There are extreme differences in the measurement of TV viewing. Some examples will illustrate this. Doob and MacDonald (1979) counted the number of programs respondents had listed. Perse (1986) asked respondents how much TV they had viewed the day before the interview and how much they viewed on an “average” day and computed a mean from those values. Others used self-reports, diary methods or even set meter data (Bryant, Lucove, & Evenson, 2007).

There is another reason why the exposure variable may become a cause for concern in the future. Television viewing used to be an activity that was easy to delineate: there were relatively few channels. With recent developments TV viewing is becoming increasingly difficult to measure. People can watch TV on TV sets, computers, even mobile phones. They watch what is being broadcast, but may be equally likely to pay per view or call up content “on demand.” New generations emerge who may not watch entire programs, but rather look at particular scenes on Internet channels such as YouTube. It is becoming increasingly difficult to measure TV exposure reliably.

(3) *The challenge from other disciplines.* Many general introductions to sociology, psychology or political science hardly mention the media when they deal with how people are socialized or learn about their environment and the world. Bandura (1994, p. 67) remarked that “most psychological theories were cast long before the advent of enormous advances in the technology of communication. As a result, they give

insufficient attention to the increasingly powerful role that the symbolic environment plays in present-day human lives.” The same applies to sociology, political science, anthropology, and other fields. This appears to be changing rapidly. Many fields are becoming aware of the potential impact of the media in general, and television fiction in particular. Studies now appear which are, in essence, cultivation studies. Much of the research on “the *CSI* effect” (based upon the hypothesis that the way in which forensic science is presented in the crime show called *CSI* is influencing how juries perceive evidence in court cases) was published in law journals (Kim, Barak, & Shelton, 2009; Tyler, 2006). Medical journals have published on the potential impact of medical fiction on people’s knowledge of medical techniques (Van den Bulck & Damiaans, 2004), or on opinions and attitudes (Czarny, Faden, & Nolan, 2008; Wicclair, 2008). Other studies have appeared on risk perception (Bakir, 2010), risky behavior (Beullens, Roe, & Van den Bulck, 2008; Beullens & Van den Bulck, 2008; Villani, 2001), and so on.

Some of this research is fairly limited and simply applies the idea of fiction effects to areas media scholars have not thought of. The potential impact of emergency room drama on perceptions of the efficacy of resuscitation techniques is probably a typical example (Van den Bulck & Damiaans, 2004). In the long run, however, these developments pose two threats to the field of media effects and cultivation research. First, researchers from other fields generally fail to acknowledge (and are probably largely unaware of) the work done in our field. Second, not all of these studies can be catalogued as trivial applications of the idea that fiction may affect perceptions. Sociologists, psychologists, and others may be publishing interesting avenues for further research that have direct relevance to our own discipline (Bryant et al., 2007).

Cultivation researchers (and media effects researchers in general) should catalogue and monitor what other fields do with (and to) this subject.

(4) *What IS cultivation?* As new media and new types of content emerge, people have started to wonder what other types of media content may have cultivation effects. Some have looked at the news (Gross & Aday, 2003), or computer games (Beullens et al., 2008; Van Mierlo & Van den Bulck, 2004; Williams, 2006), but questions about the effects of Internet pornography (Peter & Valkenburg, 2009), music videos (Givens & Monahan, 2005), or other messages may be as important as the much older question of whether even cartoons can contain lessons about reality (Funkhouser & Shaw, 1990; Gerbner et al., 1980a; Potter, 1988b; Shapiro & Chock, 2003; Snow, 1983).

The Final Challenge: Toward a Sociology of Cultivation?

Cultivation theory is usually referred to as a media effects theory and much of the recent research on cultivation has been conducted from a psychological point of view

by looking at processes explaining how, why and when television messages affect people's perceptions or judgments. While the Gerbner school has acknowledged the advances made by those seeking to understand how cultivation might work (Morgan, 2009), a psychological approach to cultivation may not do justice to the theory. Empirical research on cultivation typically yields the small relationships discussed above. Jensen and Rosengren (1990) once remarked that television viewing never explains more than 10–20% of the variance of effect variables. Cook et al. (1983), however, pointed out that the *correlations* found are usually in that .10 to .20 range, which actually means that television viewing only explains about 1–4% of the variance.

This apparent weakness of cultivation research may be a limitation of the approach, not of the theory. Most research on cultivation has been done using cross sectional designs. There are rare exceptions using experimental approaches. Gerbner remarked long ago, however, that finding evidence of cultivation may not be that easy. First, light and heavy viewers of television all live in the same world. Those who do not watch television may be influenced by those who do (Morgan & Signorielli, 1990, p. 20). Busselle (2003), for instance, showed that children whose parents watched a lot of crime on television became more frightened about crime themselves, regardless of how much crime they watched themselves. Conversely, Van den Bulck and Van den Bergh (2005) remarked that children often influence, even socialize, their parents. Children also socialize each other. Those who do not watch a particular TV show may join in play with children who do watch it and may therefore be exposed to certain meta-narratives indirectly. Finding differences between heavy viewers and light viewers may thus be difficult. If both extremes of the TV viewing spectrum have been influenced the absence of a correlation between effect and TV viewing becomes meaningless.

Second, cultivation is a long-term process (Rosengren, 1994). It assumes that continuous exposure to countless similar messages will gradually affect people's world view. As such it is unlikely for a large effect to be demonstrated in the short run (Gerbner et al., 1994). In fact, on several occasions Gerbner and his co-authors remarked that cultivation theory was not a stimulus-response theory (Morgan & Signorielli, 1990, p. 18). "Thus, television neither simply 'creates' nor 'reflects' images, opinions and beliefs. Rather, it is an integral aspect of a dynamic process" (Gerbner et al., 1994, p. 23). Too often researchers have assumed that "no change means no effects" (p. 45), while the lack of change (and the preservation of the status quo) may be one of the most important societal effects of the media.

Even though further developments in the psychology of cultivation, studying the processes through which narratives affect people's perceptions of the real world, are important, cultivation theory is now in need of a macro theory, a sociology of cultivation. Some attempts have been made, for instance, to apply Berger and Luckmann's (1976) sociology of knowledge to the study of media effects (Bilandzic, 2006; Van den Bulck, 1999).

Communication and media research once developed out of the interests of a number of sociologists, but the two disciplines drifted apart (Pooley & Katz, 2008).

Sociology is only now, and quietly, rediscovering the media as a field of study. A comprehensive theory on how the *symbolic environment* of television is affecting the *Lebenswelt* might be just what the doctor prescribed.

Framing and Priming Effects

Exploring Challenges Connected to Cross-Level Approaches in Media Effects Research

Bertram T. Scheufele and Dietram A. Scheufele

ABSTRACT

This chapter provides an overview of cognitive media effects and processes in the field of political communication. We examine the central role that accessibility-based and applicability-based models, such as priming and framing, have played in refining our understanding of communication effects at different levels of analysis. We then outline the theoretical and methodological challenges of such multi-level or cross-level approaches. In particular, we first present a formal blueprint for a multi-level model of media effects. Based on this overview, we discuss framing and priming effects at the micro-level. Here, we integrate disciplinary literatures especially from psychology and communication, and distinguish the theoretical promises underlying accessibility and applicability based models of media effects. Furthermore, we outline different forms of framing and priming effects on meso- and macro-level units. Finally, the cross-sectional challenges of modeling multi-level media framing and priming effects are discussed.

Priming and Framing – Modern Paradigms of Media Effects

Media effects models have changed considerably over the course of the last century (for an overview, see McQuail, 2005). Magic bullet or hypodermic needle models, assuming that mass media have a strong and direct effect on a largely monolithic audience, dominated most of the early empirical studies in our field (Katz & Lazarsfeld, 1955).

In the late 1930s and 1940s, Lazarsfeld and his colleagues (e.g., Lazarsfeld, Berelson, & Gaudet, 1948) shifted the focus of media effects research toward a more refined understanding of (a) the audience, and (b) the communication process. Two concepts were particularly important in models of limited media effects: two-step flows of information, and reinforcement (Katz, 1957). The two-step flow idea refers to a process in which highly informed and socially-connected opinion leaders pass on relevant information to lay audiences (for an overview, see Weimann, 1994). Information, in other words, does not reach audiences directly, but is passed on through opinion leaders. Lazarsfeld et al.'s results also showed that most persuasive effects were reinforcement effects rather than attitude change, since lay audiences tended to selectively expose themselves to ideologically consistent messages.

In the mid-1970s, arguments against this limited effects model were raised simultaneously in Europe and the United States. In Germany, Noelle-Neumann offered her spiral of silence model as a new way of modeling strong media effects on people's perceptions of opinion climates and social norms, fueled by various social-psychological traits and processes (Noelle-Neumann, 1974). Her call for a "return to the concept of powerful mass media" (Noelle-Neumann, 1973) was echoed by Gerbner and colleagues who proposed a cultivation model of media effects (Gerbner & Gross, 1974). Cultivation attributes strong mainstreaming effects to commercial media systems, particularly television.

The 1980s and 1990s, finally, marked the transition to what is seen as the current paradigm of "negotiation" models of media effects (McQuail, 2005). The media effects theories subsumed under this umbrella are also often referred to as cognitive models of media effects (D. A. Scheufele, 2000a). They are distinguished from the strong effects paradigms of the 1970s in at least two respects.

First, many of the recent effects models have acknowledged the inherent contingent nature of media effects (Eveland, Jr., 1997), depending on a host of orientations (McLeod, Kosicki, & McLeod, 2009) that audiences use to make sense of and interpret communication content. This "negotiation" of meaning between communicated content and audience interpretation is also from where the paradigm derives its name.

Second, the focus of inquiry in the current approach to media effects has shifted away from Noelle-Neumann's or Gerbner's foci on the *social-level* outcomes of mass

communication, to the interplay between message systems and audience characteristics at different levels of analysis (D. A. Scheufele, 1999). Since the 1980s, our field has therefore seen repeated calls for multi-level approaches to media effects (Pan & McLeod, 1991), bridging micro-, meso-, and macro-levels of analysis.

Some of the most dominant effects models subsumed under the “negotiation” paradigm of media effects are agenda setting, priming, and framing. Agenda setting usually refers to the idea that more frequent or more prominent media coverage also increases our perceptions of how important we think an issue is or how easily we can retrieve it from memory when needed (McCombs, 2004; McCombs & Shaw, 1972, 1993). Priming (at least in the context of this media effect paradigm) extends the agenda-setting model and argues that the issues that have been made most easily retrievable in voters’ minds by mass media, will also be the ones that voters take into account when judging the performance or other traits of candidates (Iyengar & Kinder, 1987). Framing, finally, refers to the idea that the mode of presentation of a message (i.e., a message frame), can shape how audiences interpret this message by establishing implicit linkages to audience’s pre-existing interpretive schema (D. A. Scheufele, 1999; Tewksbury & D. A. Scheufele, 2009). Before exploring the specific effects models in this paradigm and their differences in greater detail, however, it is necessary to first explore the multi-level assumptions underlying all of them.

A Multi-Level Matrix for Media Framing and Priming Effects

A model of multi-level framing and priming effects is most easily illustrated by structuring levels of analysis around relevant social collectives (B. Scheufele, 2011). Such classifications can follow a formal hierarchy where the level of analysis is determined by the size of the collectives that are being studied (e.g., Lazarsfeld & Menzel, 1961). Smaller collectives, in such a model, are referred to as the micro-level whereas the larger collectives would be referred to as the meso- or macro-levels. Multi-level analyses (e.g., Hayes, 2006; Hox, 2002) rely on similar classifications.

Multi-level classifications can also be made by tying levels to social entities. Here, the individual recipient, for instance, marks the micro-level, social groups or political organizations represent the meso-level, and the political system with its communication structures is located at the macro-level. Classifications tied to social entities have been introduced by scholars in political science (e.g., Eulau, 1977), sociology (e.g., Alexander, Giesen, Münch, & Smelser, 1987; Coleman, 1994) and communication (e.g., McLeod & Pan, 1989; Pan & McLeod, 1991).

Regardless of how distinctions are made between different levels of analysis, the question arises about how to conceptualize (communication) processes linking different levels of analysis. Coleman’s (1994) seminal work – often referred to as the “Coleman bathtub” (e.g., Oakes & Kaufman, 2006, p. 11) – distinguishes three

“propositions” which are explained by using the example of Weber’s (1958) “The Protestant ethic and the spirit of capitalism.” (1) The first proposition links the macro- to the micro-level, and explains how the social situation and the individual’s knowledge, motives or values interact by applying a bridge hypothesis. (2) The second proposition links the individual’s values with his or her “economic behavior” (both at micro-level). Here, “[i]ndividuals with certain values (referred to in proposition 1) adopt certain kinds of orientations to economic behavior” (Coleman, 1994, p. 8). This is similar to Esser’s (1999) rational-choice theory of social behavior, which assumes that subjects weigh different behavioral options and choose the one promising the best outcome. (3) The third proposition links the micro- back to the macro-level and explains how individual economic behavior leads to capitalism as a macro-phenomenon: “Certain orientations to economic behavior (referred to in proposition 2) on the part of individuals help bring about capitalist economic organizations in a society” (Coleman, 1994, p. 8). Esser (1999) calls this the logic of aggregation, which affords rules of aggregation or transformation in order to explain how social phenomena at a higher level emerge from individual behavior at the micro-level.

We are especially interested in what Coleman (1994) calls “Macro-to-Micro and Micro-to-Macro Transitions.” And, in fact, a very similar multi-level matrix based on the Coleman bathtub was provided by Pan and McLeod (1991) for mass communication. They speak of “cross-level linkages” in general, as well as of a “top-down” linkage in terms of the macro-micro-transition and a “bottom-up” linkage regarding the micro-macro-transition. B. Scheufele (2008) applied these ideas more specifically to media effects approaches. Using media coverage of violent antiwar demonstrations as one example, he refers to “bottom-up” media effects if mass media not only influence individuals (e.g., a single protester), but also shape the attributes of meso- or macro-units (e.g., the amount of violence of a demonstration). Conversely, he speaks of “top-down” feedback from a higher to a lower level of social aggregation if, for instance, the amount of violence at a demonstration provokes other protesters to attack the police.

These multi-level linkages are illustrated in Figure 3.1. In a first scenario, for instance, one could imagine two individuals (A and B) who are unfamiliar with antiwar demonstrations. Their willingness to participate (YA and YB) in a demonstration is low, since both the mass media (M) and their family (X1) or friends (X2) tell them that demonstrations are often interrupted by violent protesters. Three other subjects (C, D, and E) may be antiwar activists (X3) and therefore participate in a demonstration against, for instance, “Operation Iraqi Freedom” in 2003. The size of this demonstration (Z) – formally speaking, an attribute of the meso-unit “demonstration” – is therefore $N = 3$.

A second scenario assumes a different kind of media framing. Here, the mass media consistently frame “Operation Iraqi Freedom” as an unjustified delayed response to 9/11. Subjects A and B, in this scenario, may be mobilized to attend the rally partly based on these media reports, but also partly because their friends

Figure 3.1 Micro-macro and macro-micro links. Adapted from B. Scheufele (2011). *Jenseits des Rezipienten. Die Herausforderungen für die Medienwirkungsforschung durch die Mehr-Ebenen-Problematik am Beispiel von fünf Wirkungsbereichen*. In T. Quandt & B. Scheufele (Eds.), *Ebenen der Kommunikation. Mikro-Meso-Makro-Links in der Kommunikationswissenschaft* (p. 118). Wiesbaden, Germany: VS Verlag für Sozialwissenschaften.

and family themselves follow the news and tell them that the invasion of Iraq was not justified. In this second scenario, therefore, media coverage contributes to the size of the demonstration “Operation Iraqi Freedom,” measured by the number of protesters which is now $N = 5$. This micro-meso transition can be considered a bottom-up media framing effect (up arrows in Figure 3.1). If the course of the demonstration is peaceful, A and B may participate in a future demonstration again. This meso-micro-transition can be considered a top-down feedback (down arrows in Figure 3.1) from the demonstration that A and B experienced (meso-level) to their willingness to participate in a subsequent demonstration (micro-level).

A third scenario replaces “subject” by “group” (each of them with $N = 10,000$). In other words, the antiwar demonstration has no longer five, but 50,000 participants and individual effects are now extrapolated to collectives. McQuail (2005) describes such “collective reaction” as follows: “Here some of the same effects are experienced simultaneously by many people in a shared situation or context, leading to joint action usually of an unregulated and non-institutional kind. Fear, anxiety and anger are the most potent reactions, which can lead to panic or civil disturbance” (pp. 468–469).

Based on this model, media effects theories, including priming and framing, need to be understood as processes that simultaneously influence individual, group and social outcomes. In the following sections, we therefore delineate each effects model at each unit of analysis, and then return to the model outlined in Figure 3.1 to discuss broader implications and future agendas for political communication research.

Framing and Priming at the Micro-Level

The various models of framing and priming effects have their explanatory foundations at the micro- or individual level. The broadest distinction at that level of analysis is the one between *accessibility*-based and *applicability*-based models of media effects (Price & Tewksbury, 1997).

Accessibility-based models include agenda setting and framing. Both effects models assume that the amount and prominence of media coverage of an issue can also increase how important audience members think these issues are or how easily they can retrieve them from memory (for an overview, see D. A. Scheufele, 2000a). Agenda setting and priming – in this context – have to be understood as two steps in a chronological series of effects. Agenda setting refers to the transfer of salience from mass media to audiences. Priming as a subsequent step, assumes that mass media can “prime” issues by making them more salient and – in turn – also activate related concepts in people’s minds. This is usually referred to as spreading activation (Collins & Loftus, 1975). As a result, the salient issue and related concepts are more likely to be used for subsequent judgments about candidates or issues (Hastie & Park, 1986).

Applicability-based models are distinctly different. They do not rely on the idea of increased salience and ease of retrieval, but instead assume that the effect of messages depends on their applicability to pre-existing interpretive schema. The degree of applicability can increase or decrease, depending on how a message is framed. Kahneman’s Nobel-prize winning work on prospect theory nicely illustrates this phenomenon. Respondents were shown an ambiguous stimulus in the form of a set of symbols that could be interpreted as numbers or letters. Respondents who saw the ambiguous stimulus embedded in a series of numbers interpreted it consistent with the surrounding frame, that is, as numbers, and respondents who saw it embedded in a set of letters interpreted it as letters (Kahneman, 2003).

Some researchers have treated applicability and accessibility models as equivalent (McCombs, 2004). We disagree with this view, and suggest that the two models are distinctly different. Priming (and agenda setting) focuses on what has been made salient by media coverage and how we use it for evaluations. The core process underlying priming and agenda setting, therefore is the ease with which a mediated issue can be retrieved from memory. Framing, in contrast, is largely unrelated to ease of retrieval of the mediated message. Instead, it focuses on how well the message

resonates with pre-existing schema (for an overview, see B. T. Scheufele & D. A. Scheufele, 2010).

This distinction becomes even clearer when we think back to the characteristics of the negotiation paradigm of media effects outlined earlier. One of these characteristics was the interaction of audience characteristics with the features of the mediated message. Agenda setting, first formulated in the heyday of the strong effects paradigm of the 1970s (McCombs & Shaw, 1972), assumes that the transfer of salience from media to audiences is a universal phenomenon that occurs across all groups of society. In fact, most of the early agenda-setting research tested its hypotheses by comparing methodologically questionable rank-orders of the most salient issues in news media to issue rankings in national Gallup polls (Funkhouser, 1973a, 1973b).

Framing, in contrast, is firmly embedded in the negotiation paradigm. It assumes that framing effects are stronger for messages that better resonate with socially shared schema, or for groups who are more familiar with the schema that a particular frame is applicable to. “Three strikes and you’re out” legislation in the United States is a good example. Without explaining the specifics of the legislation, it provides audiences with an intuitive understanding of the basic idea behind it. The “three strikes” frame is likely to be much more effective among US audiences for whom it resonates with an underlying shared schema. For audiences in Europe, this frame would be much less effective.

B. Scheufele (2004) picked up the argument of applicability and socially shared schema, but added two important other types of framing effects: The first one is called transformation effect: If media reports repeatedly frame an issue in a consistent fashion, audience schema can be modified step by step in terms of this media frame (see also B. T. Scheufele & D. A. Scheufele, 2010). A second, and partly related effect is called the establishing effect: If no socially shared audience schema is available, such a schema can be established by cumulative and consonant media framing. Such an effect should be more likely for issues or situations totally unfamiliar for most audience members. These two effects do not contradict the negotiation model of framing and priming effects, but rather complement and specify it. Finally, framing and priming can also result in shifts of opinions. Such attitudinal changes are quite different from the aforementioned persuasive media effects (Nelson, Oxley, & Clawson, 1997).

In short, agenda setting, priming and framing are all processes that can explain cognitive effects at the individual or micro-level. In particular, they provide insights into how media transfer salience to individual audience members (agenda setting) and potentially shape their evaluations of policies or political actors (priming). With a parallel logic, they can shape how issues are being discussed among audiences (frame setting) and how those frames affect outcomes, such as attributions of responsibility or other issue stances (individual-level framing effects) (D. A. Scheufele, 1999). More importantly, however, both accessibility and applicability models have implications well beyond the individual level.

Framing and Priming Effects at the Meso- and Macro-Levels

As outlined earlier, framing and priming models are largely based on theories adopted from cognitive psychology and try to explain how cognitions, emotions, opinions, and behavior of *individuals* are shaped by media framing and priming. But what about media effects on *units at higher levels of analysis*, such as public discourse, the political arena, or social movements? A number of scholars in sociology, for example, have suggested that attempts by non-governmental organizations (NGOs) or other social movements to create and promote frames need to be examined using a collective identity approach (e.g. Gamson, 1992; Gamson & Modigliani, 1989). By the same token, however, it is also reasonable to ask whether predominant media framing or priming can promote or undermine a social movement's framing activities. This would be a media effect on a unit at the meso-level.

Sociological Approaches – Framing Beyond the Micro-Level

Traditional framing and priming effects approaches provide few insights into how media framing and priming alter the pattern of public discourse on a topic, how they support or undermine particular policy stances, or how they strengthen or weaken social movements more generally. A more exhaustive, multi-level model of framing or priming effects, therefore, needs to combine *sociological traditions of framing research* with other theories of media effects, such as the spiral of silence theory (Noelle-Neumann, 1974; D. Scheufele & Moy, 2000). We will discuss some of these connections in greater detail later on in this chapter.

Although the sociological tradition of framing research is largely agnostic of the historical backdrop of media effects research, two strands of this tradition are nonetheless relevant for a multi-level model of framing and priming effects. The first strand focuses mostly on framing in the context of social movements and mobilization (Snow & Benford, 1988, 1992; Snow, Rochford, Worden, & Benford, 1986). The second emphasizes the aspect of collective identity (e.g. Gamson, 1992; Gamson & Modigliani, 1989) (for an overview, see Opp, 2009).

According to mobilization-based approaches (e.g., Snow & Benford, 1988) social movements “frame, or assign meaning to and interpret relevant events and conditions in ways that are intended to mobilize potential adherents and constituents, to garner bystander support, and to demobilize antagonists” (p. 198). Anticipating similar distinctions in the communication discipline by Entman (1993), Snow and Benford (1988) highlighted problem definition (*diagnostic framing*) and treatment recommendation (*prognostic framing*) as important frame elements. But their conceptual framework also emphasized the *motivational* aspect of a movement's framing

strategy: First, a movement has to define what the problem is (e.g., globalization) and attribute responsibility, i.e. who can be blamed for it or can be held responsible (e.g., capitalism). Second, the movement has to offer solutions or strategies to solve the problem (e.g., fair trade). Third, a social movement has to mobilize its existing members, but also call other people (e.g., through leaflets or the Internet) to support or join the movement.

Snow et al. (1986) distinguish four types of frame alignment necessary to gain support: *Frame bridging* means connecting frames and thereby bringing together people who share similar views or ideologies. With *frame amplification* the movement addresses core values of society (e.g., freedom, humanity) which can serve as a “springboard for mobilizing support” (Snow et al., 1986, p. 469). *Frame extension* and *transformation* are somewhat self-explanatory: A social movement sometimes has to extend or transform its framing strategy in order to attract a broader cross section of people.

Collective-identity approaches (e.g., Gamson, 1992; Gamson & Modigliani, 1989) expand on mobilization-based approaches and commonly distinguish three components of “collective action frames:” The first component – *injustice* – refers to the feeling among movement participants that they are not being treated fairly. The *agency* component addresses people’s awareness of being able to change things and influence (political) decisions through collective action. The *identity* component, finally, represents the in-group feeling which triggers collective action.

Using the example of nuclear energy, Gamson and Modigliani (1989) saw at least two roles for mass media in the context of social identity: On the one hand, mass media serve as an arena or playground for public discourse. On the other hand, they stimulate public discourse by providing interpretative packages and framing devices, such as metaphors, key words or exemplars.

Although these framing concepts have been applied to media framing (e.g., Eilders & Lüter, 2000), they were initially defined as attributes and tools of social movements, rather than media coverage or even media effects. The multi-level matrix presented in Figure 3.1 therefore takes these concepts a step further and connects them to media effects research. It outlines how the sociological and psychological approaches mentioned earlier can be integrated into a multi-level model of media framing and priming effects.

The target or *dependent variable* of such effects may be a social group, an organization or a political system. But according to D. A. Scheufele (1999) media frames themselves can be the dependent variable: Social groups try to promote their perspective and thereby influence how other NGOs or policy groups, for instance, think about an issue. These processes of “frame building” and “frame setting” (D. Scheufele, 1999) have been examined in several studies (e.g., Cohen & Wolfsfeld, 1993; Entman, 2004; McAdam, 1994; Miller & Riechert, 2001; Walgrave & Manssens, 2005).

One of the more exhaustive summaries of research on framing strategies and activities in terms of political deliberation was provided by Pan and Kosicki (2001). Their analysis also moves this line of research from the earlier, more conceptual work

to the “real political consequences” (p. 51) of framing activities during the 1992 presidential race: “The candidate who pledged to keep healthcare reform on top of his domestic agenda was swept into the White House and the Democratic Party maintained a sufficient working majority in both House and Senate” (p. 51). This was not only a result of efficient agenda building (Cobb & Elder, 1971), but also a result of successfully *framing* the issue as a question connected to social security and therefore effectively shifting evaluations of the presidential candidates toward these issues.

How media framing and priming contribute to political outcomes (e.g., elections, political decisions) can be considered a *bottom-up media effect* (see Figure 3.1): Media framing (see M in Figure 3.1) influences voting behavior of individual members of the electorate at the micro-level (see, for example, Y_A in Figure 3.1) as described by Price and Tewksbury (1997). Furthermore, media framing has an impact on the election outcome at the macro-level (see Z in Figure 3.1). This follows a simple *rule of aggregation*: All voting decisions Y_N (micro-level) sum up to the election victory Z of a political party (macro-level). In other cases, however, modeling media framing or priming effects on meso- and macro-units can be quite challenging.

Cross-Sectional Challenges of Modeling Multi-Level Media Framing and Priming Effects

When modeling multi-level media framing and priming effects, we face at least four problems.

(1) We already outlined the problem of *linking levels* in the “Operation Iraqi Freedom” scenario. Media coverage of terrorism provides another good illustration (e.g., Brosius & Weimann, 1991; Nacos, 2002; Stohl & Stohl, 2007; Tsfati & Weimann, 2002;). Terrorists try to gain public awareness for what they assume to be social or political problems, and try to promote their ideologies via televised messages, attacks on civil and military targets, and so on.

The first two activities are similar to what Snow and Benford (1988) called diagnostic and motivational framing. The terrorist attacks on Spanish trains prior to the Spanish national elections in March 2004, for example, were covered extensively by Spanish and international media. In the last days of the election campaign, the attacks and media reports had indirectly supported the Socialist party, which was a strong opponent of the Spanish involvement in “Operation Iraqi Freedom.” Since the media had framed the late election phase around the larger theme of terrorism, the electoral victory of the Socialist Party – and subsequently the withdrawal of Spanish troops from Iraq – was partly a media impact on the macro-unit “political system,” and not just a simple individual-level media framing and priming effect on individual Spanish citizens as the micro-unit.

In addition, mass media themselves were a target of framing or priming. According to Nacos (2002) terrorists try “to win media attention and news coverage for their actions, their grievances, and their political ends” (p. 10). It is therefore difficult to separate media effects at various levels from other confounding factors. In other words, research on framing and priming effects on terrorism needs to explore a complex interplay of different units at the micro-, meso-, and macro-level. Among them are poverty or historically grounded hostilities, the ideologies of terrorists, mass media as the conveyor of terrorism-related messages, the Internet as a tool for recruitment and planning or attacks, but also as a communication platform for terrorists (Tsfati & Weimann, 2002), the activities of supporters, the fear of the public, and finally the decisions and debates in various national and international political arenas. Mass media play both a mediating and a shaping role in this context (e.g., Nacos, 2002). So, it is not only the media who prime politicians and the public by applying a certain frame – it is political actors themselves who frame and prime the issue according to their own preferences.

Similar problems can occur when we study media framing and priming effects in the context of social movements (e.g., Opp, 2009). Framing and priming effects operate from lower to higher levels of analysis and backwards through a complex set of *cross-level interactions*. This includes frame and agenda setting by mass media, citizens’ beliefs and predispositions (micro-level), the dynamics of demonstrations or the structure of particular social movements (meso-level), as well as the political decisions or even economic structures of a country (macro-level). The 2007 G8 summit in Heiligendamm (Germany) is a good example. Mass media *framed* the demonstrations around instances of violent opposition, and therefore shaped how the public, the police, and the demonstrators understood the events surrounding the summit. Yet, media coverage of the protests (meso-level) may also have shaped people’s willingness to participate in subsequent demonstrations (micro-level). We called this *top-down feedback* earlier (see down arrows in Figure 3.1). Some people, for instance, may be concerned about repeated reports about instances of violence and decide not to participate in future rallies. Others may feel provoked by media portrayals of violence and get even more violent, thereby reinforcing this “spiral of violence.” Again, it is difficult to separate the framing and priming effect of media coverage from the impact of other factors.

(2) The second challenge relates to *group contexts*. When we study micro-level framing effects we can easily measure cognitions, emotions, opinions or reactions of an individual recipient. But with groups it is fairly difficult to isolate the specific role that media play in impacting group-level variables. Social protest is collective action either in the “smaller form” of a single demonstration or in the “larger form” of a social movement. Thinking back to Figure 3.1, the size of a protest or the violence of a demonstration or movement is therefore an attribute of a meso- or macro-level unit (Z). However, it is virtually impossible to establish if an individual participant’s behavior (Y) is influenced by media coverage (M), and in which direction. More importantly, direct media effects may not even be a prerequisite for change, since

demonstrators may be exposed to them *indirectly* through interpersonal channels (e.g., D. Scheufele, 2000b).

These group level confounds are further complicated by what is called *reciprocal effects* (Kepplinger, 2007; Lang & Lang, 1953). These can occur if a demonstration becomes more violent, for example, due to television teams being on-site. Such reciprocal effects make it even more difficult to isolate the specific impacts of initial media framing and priming. In sum, media framing and priming effects beyond the micro-level require significant conceptual thinking about the social dynamics surrounding them.

(3) The third problem concerns the *mechanism of framing or priming effects*. This problem relates to the rules of aggregation or transformation mentioned earlier. According to Schulz (2009), models of learning, attitude change or information processing are not necessarily applicable to media effects on meso- or macro-level units. Moreover, other types of media effects have to be taken into account. As Halloran, Elliott, and Murdock (1970) outlined, media often create narratives around expectations about violence occurring, even before demonstrations take place. According to Merton (1996, pp. 41–50), such media framing can lead to a *self-fulfilling prophecy*: If media frame a demonstration in terms of violence before it actually occurs, they also influence interpretations and expectations among other social groups, such as the police. The police may deploy additional units to the demonstration, based on these media reports, which – in turn – can provoke demonstrators and trigger attacks on the police. These attacks trigger stricter enforcement by the police, which will further provoke protesters. The amount of violence at the demonstration (meso-level unit), therefore, is – at least in part – a result of the initial media framing, but also of various subsequent group dynamics, which are themselves triggered by media framing. Such a “spiral of violence” resembles the spiral of silence as described by Noelle-Neumann (1974): People monitor the opinion climate, and speak out or remain silent if they assume themselves to be of the opinion majority or minority. This stimulates a process in which the changing perception of the media climate reinforces the willingness to speak out, and so on. Schulz (2009) draws similar parallels to what he and others call the “mediatization” of the political system (see also, Kepplinger, 2002).

(4) The fourth challenge refers to the *target of framing and priming effects*. The individual recipient is – in many ways – an easy target (or unit of analysis) for empirical research. Yet, social movements, organizations, or even the political system are in many ways more relevant dependent variables. Unfortunately, shifting the dependent variable to group-level entities also requires an examination of the *structure* of these entities. For instance, if we explore media effects on an only loosely structured group, the dynamics of in- and out-group behavior (e.g., Tajfel, 1982) may explain how media framing and priming effects on each group member (micro-level) also affects the collective action of the whole group (meso-level). This could be called a *follow-up effect*. Organizations, however, are characterized by very different structures (e.g., Scott & Davis, 2007; Taylor, 1993). Media coverage is not perceived by an

organization as a whole, but by its individual members. For instance, if the media frame an issue in such a way that opposes a particular political party's goals, the party leaders will likely distribute talking points and other framing documents that help other party members and campaign activists to *counterframe* these media reports. Here, media framing leads to a top-down feedback within the organization.

But the target of coverage could also be the party members who may read reports about their party leader being involved in a political scandal. Following the *third-person effect hypothesis* (e.g., Davison, 1983), these party members may fear that the electorate could vote for an opposition candidate in upcoming elections because of what they assume to be strong effects of the media coverage surrounding the scandal. Therefore, party members may communicate with other party members in order to oust their leader and avoid further political damage. This example proves that the group-level outcomes of individual-level framing effects are much more complicated than modeled previously, and other types of media effects have to be considered when we want to explore media framing and priming effects beyond the micro-level.

Longitudinal Challenges of Modeling Multi-Level Media Framing and Priming Effects

Finally, priming and framing research faces at least three problems connected to longitudinal considerations.

(1) The first problem refers to *reciprocal bottom-up and top-down transitions*. It can be illustrated by referring – once again – to the spiral of silence theory. Here, “the perception-to-expression-to-reinforcement process constitutes a major cross-level mechanism with bidirectional flow of causal forces” (Pan & McLeod, 1991, p. 158). Based on a spiral of silence model, the position seen by the public as winning or in the majority will – over time – establish itself as public opinion. Although only a small percentage of the electorate may in fact change their individual opinion (micro-level) based on public perceptions of the predominant opinion climate, this small group may change the outcome of a closely-contested political race (macro-level). The final target of media effects in the spiral of silence model, therefore, is located at the macro-level, that is, election outcomes or social norms. Again, not only media coverage, but several other factors contribute to this effect at the macro-level.

Similar cross-level dynamics have been discussed using the example of the anti-globalization protest at the G8 summit in Heiligendamm. Here, the framing strategies of the anti-globalization movement, the media reports, the overall opinion climate, the individual willingness to demonstrate, and finally the internal dynamics of a demonstration produce a complex cross-level interplay of factors. Yet, this cross-level structure is not static, as illustrated somewhat simplistically in Figure 3.1, but dynamic in the sense of alternating or simultaneous bottom-up and top-down transitions.

(2) The aspect of *follow-up effects of media framing and priming* can be illustrated by using the example of the Spanish national elections in 2004 again. After the terrorist attacks, mass media, politicians, and other actors framed the final stage of the election campaign largely in terms of terrorism. Voters following these media reports were therefore also more likely to judge the parties in terms of their position towards the Spanish involvement in Iraq – with the Socialist Party being a strong opponent of this commitment. Such media framing and priming effects operate at the level of the individual voter (micro-level). Some voters were primed by the media while others already favored the Socialist Party for other reasons (see subjects A and B in Figure 3.1). The tally of all voters' decisions (see Y_A and Y_B in Figure 3.1) produced the electoral victory (see Z in Figure 3.1) of the Socialist Party. But the election outcome is not the only follow-up media effect. Another one is the Socialist Party's withdrawing of Spanish troops from Iraq prior to the election.

Another example is the evolution of a single demonstration into a more long-term climate of anti-globalization protests. If mass media create an *a priori* narrative of anti-globalization demonstrations around violent protests, as outlined earlier, they may actively contribute to such violence at the specific upcoming demonstration through a self-fulfilling prophecy. In addition, such framing – as well as the violence actually occurring – can shape the overall climate of protest in the long run. Both, protesters and the police will prepare better for each forthcoming summit. The police will send more police units and the protesters will be organized better themselves. The demonstrators will act more violently and the police will enforce laws more strictly. Whether such outcomes can still be perceived as a media effect may differ from case to case. The multi-level blueprint in Figure 3.1 at least gives a formal answer: Changes at higher levels can be called a follow-up media effect if a *significant amount of variance* at the higher level can be *traced back to media framing and priming*. Of course, other factors contribute to this as well, for instance, the financial resources or the framing activities of a social movement. Media may support or undermine social movements by framing and priming. But it is difficult to measure the empirical mechanisms behind these dynamics empirically. Thus, most aspects of cross-level dynamics almost inevitably remain an empirical blackbox, which even methodically sophisticated studies of long-term framing processes are unable to open (e.g., Ferree, Gamson, Gerhards, & Rucht, 2002).

(3) A final challenge is related to the *dynamic structure of the target* of framing and priming effects on units at higher levels. According to the spiral of silence theory, each person remaining silent will increase perceptions about opposing views gaining strength. As a result, opinion climates are changing almost continuously. Framing and priming are similar. If media frame a demonstration in terms of violence, they not only influence those people who are willing to protest in the first place, but also those who may have considered demonstrating but are now discouraged by the prospect of violence. As a result, fewer people may attend the rally and those actually protesting may appear even more violent. Here, media framing not only influences individuals (micro-level), but also has an *indirect impact on higher levels of social aggrega-*

tion. For instance, media reports during a G8 summit have an impact on the demonstration at this summit. But the amount of protesters or people's readiness to act violently may already be a result of earlier media reports, which offered narratives of violent protests at this summit (see also Kepplinger, 2007).

Conclusions

This chapter explored priming and framing as media effects theories beyond the micro-level approaches that have dominated much of the work in political communication. We first positioned this line of research in current models of media effects, which have shifted away from Noelle-Neumann's and Gerbner's foci on the *social-level* outcomes of mass communication. Instead, we urge researchers to fully explore negotiation models of media effects, that is, models that hypothesize interactions among micro-, meso-, and macro-levels of analysis, regardless of many of the resulting complexities outlined in this chapter. This would also allow us to more explicitly connect the psychological tradition of framing and priming effects research, on the one hand, and sociological approaches to framing, on the other hand, at a conceptual level.

Second, as our overview shows, agenda setting, framing, and priming effects cannot be fully understood unless they are linked successfully to other theories or models of media effects. The spiral of silence theory or the third-person effect hypothesis have already been incorporated in our considerations about framing and priming effects at the meso- and macro-level, and future research should more systematically explore connections between these different effects models and their outcomes of different levels of analysis.

Examining Media Effects

The General Aggression and General Learning Models

Christopher P. Barlett and Craig A. Anderson

ABSTRACT

The study of screen media effects is becoming especially important because people spend increasing amounts of time on visually realistic entertainment media. This chapter applies two related theoretical frameworks to the study of media effects: the general aggression model (GAM) and the general learning model (GLM). Both theories posit relations between media exposure and internal processes, behavior, and the development of long-term knowledge structures and attitudes. GAM focuses on the development of aggressive knowledge structures and attitudes derived from exposure to violent media depictions (amongst other aggression-related stimuli), and their relation to aggressive behavior. GLM, a broad extension of GAM, posits how long-term attitudes and knowledge structures are formed with continued exposure to any type of media (violent or nonviolent), and how “media-trained behavior” can ensue. How these processes operate, the role of individual differences, and short- and long-term consequences of media exposure are discussed.

Lessons Learned from Media

Mass media are powerful teachers. As we, and many others, have noted, the contents of mass media determines what they teach (e.g., Anderson et al., 2008; Gentile et al.,

2009). For instance, Swing and Anderson (2007) noted that electronic media have been used in the classroom to teach topics ranging from photography to flying airplanes. Gentile and Gentile (2008) showed that well-designed mass media, videogames in particular, have all of the key features of excellent teaching. The question remains: What behaviors are viewers learning from the mass media?

This chapter describes two theoretical models that predict when, why, and for whom media exposure is related to behavior. The primary focus of this chapter is to describe the general aggression model, which posits how media violence exposure is related to aggressive behavior. Then we discuss the tenets of the general learning model. This model was more recently developed from the postulates of the general aggression model, and, thus, less text will be devoted to its description. The general learning model can predict how exposure to any type of media content may be related to “media-trained behavior.” In describing these models, we discuss earlier theoretical models that led to the derivation of the general aggression and general learning models, describe the relevant research testing these theories, and describe the role that certain individual differences play in these relations. Finally, future directions and conclusions are offered.

The General Aggression Model

The general aggression model (GAM; Anderson & Bushman, 2002) is a dynamic, developmental, and social-cognitive integrative model of human aggression (see Anderson & Carnagey, 2004). GAM has the explanatory power to predict how exposure to any aggression-related stimulus (including media violence) is related to subsequent aggressive behavior. The full GAM can be dissected into two highly related sets of processes that operate in the immediate situation (proximate) or more distally. Proximate processes are those that are directly related to current aggressive behavior. Distal processes are those that tie immediate short-term effects of a given stimulus to the development of long-term aggressive behavioral tendencies.

Proximate GAM

The proximate GAM (see the lower part of Figure 4.1) begins with two types of input factors: Situation and person factors. Situational variables are those factors that the individual is currently interacting with that are related to the probability of engaging in aggressive behavior in the immediate situation. These may include exposure to media violence (Anderson et al., 2003), provocation (Bettencourt & Kernahan, 1997), heat (Anderson, 1989), and a host of other factors (Anderson & Huesmann, 2003).

Person factors are those individual difference variables that may be related directly to aggressive behavior (e.g., trait aggression, mood), or that may moderate the effects of situational variables. Research has shown that a variety of person variables

Figure 4.1 The general aggression model: a bio-social model of human aggression. From C. A. Anderson, & N. L. Carnagey (2004). *Violent evil and the general aggression model*. In A. Miller (Ed.), *The social psychology of good and evil*. Copyright Guilford Press. Reprinted with permission of The Guilford Press.

moderate the relation between media violence exposure and aggression. For instance, Bushman (1995) found that videotaped violence was more likely to increase aggression in high trait aggressive individuals than in low trait aggressive individuals. Markey and Scherer (2009) found that violent videogame exposure was related to more aggressive cognitions and aggressive affect for participants high in the psychoticism trait compared to participants with low levels of psychoticism. (See also Kirsch, Olczak, & Mounts, 2005 for the moderating role of trait hostility.)

One single episodic cycle through GAM's proximate processes focuses on how these input factors influence one's present internal state, consisting of aggressive cognitions, aggressive affect, and physiological arousal. All of these internal state variables have been predicted to be correlated with one another. For example, if one feels hostile or frustrated (aggressive affect) then those feelings may trigger aggressive thoughts. It is important to note that GAM does not state how many or which internal state variables are necessary for aggressive behavior to occur. Any one or combination of internal state variables is able to increase the likelihood of aggressive behavior. For instance, the relation between media violence exposure and aggressive behavior appears to be primarily influenced by the aggressive cognition route, although increases in aggressive affect or physiological arousal may also play a role in some cases (Anderson & Dill, 2000).

GAM further posits that the active contents of one's present internal state both influence and are influenced by a complex appraisal and decision process

(see Anderson & Carnagey, 2004). Borrowed from the attribution literature (e.g., Anderson, Krull, & Weiner, 1996), after experiencing a significant event an individual will make an initial attribution as to why it occurred. This initial appraisal can occur quickly and without conscious awareness, and may include behavioral response options. If the observer does not have the time, motivation, and cognitive resources to evaluate his or her initial attribution, then an impulsive behavior is likely to occur. However, if the person does have the time, motivation, and cognitive resources to reassess the initial attribution, then the observer must decide if the initial attribution is important and unsatisfying. If the outcome of the initial attribution is unimportant or satisfactory, then an impulsive behavior is likely to occur. If the outcome of the initial attribution is important and unsatisfying, then an individual may engage in a number of reappraisals of the event. This process iterates until the observer is satisfied with his or her attribution or until a response is required; then a thoughtful behavior is likely to occur. A thoughtful or impulsive action can be either aggressive or non-aggressive, and reappraisal does not guarantee that an initially hostile attribution will be altered. Knowledge of the input factor(s), the present internal state, and other constraints allow one to predict whether the behavioral outcome is likely to be impulsive or thoughtful, aggressive or non-aggressive.

Whether thoughtful or impulsive, aggressive or non-aggressive, the ensuing behavior influences the ongoing social encounter. This social encounter will feed back into the situational input factor. Thus, GAM posits a feedback loop that can lead to a violence escalation cycle. Anderson, Buckley, and Carnagey (2008) argued that aggressive behavior can involve any dyadic units that come into conflict with one another (e.g., two people, two nations). An event that triggers a hostile interpretation is coined as a triggering event that starts the violence escalation processes. This event can range from relatively minor perceived provocation (e.g., hearing a rumor) to a major perceived provocation (e.g., getting punched). After this initial provocation, the victim is likely to retaliate in a manner more severe than the initial provocation warranted. Next, the original aggressor is likely to retaliate with a more severe retaliatory response. This cycle tends to continue. At the person-to-person level, media violence (along with other situational and personological risk factors) is predicted to influence the knowledge structures retrieved, the extent to which the triggering event is perceived as hostile, and the specific behavioral response. Anderson et al. (2008) showed that high trait aggressiveness, paired with a minor triggering event, can initiate the violence escalation cycle.

Distal GAM

GAM incorporates a developmental cycle into its theorizing on aggression via the distal processes. Distal processes predict how continued exposure to aggression-related stimuli influences the development of one's aggressive personality (see upper part of Figure 4.1). Two types of modifiers are likely to influence the extent to which

an aggressive personality is developed. The first are biological modifiers that can influence the probability of aggressive behavior (see Raine, Brennan, Farrington, & Mednick, 1997). Anderson and Carnagey (2004) argued that such biological predispositions interact with the second type of modifier, environmental modifiers, to influence aggressive personality.

At its heart, GAM is a social learning model of aggression. Each time that an individual interacts with aggression-related situational variables serves as one learning trial. This can include the learning, rehearsal, and reinforcement of aggression-related knowledge structures (Anderson & Carnagey, 2004). Continued exposure to stimuli and situations that evoke aggressive thoughts, feelings, and behaviors will eventually lead to the development of well-practiced knowledge structures that are used to interpret events, make decisions, and ultimately increase the likelihood of aggressive behavior. Media violence provides one such exposure to aggression. Figure 4.2 illustrates a number of ways that violent media exposure can influence the development of aggressive personality. Prior to discussing the different knowledge structures, it should be noted that this is not an exhaustive list related to such development.

Figure 4.2 Effects of repeated media violence viewing. Reprinted, with permission, from the *Annual Review of Psychology*, Volume 53 © 2002 by Annual Reviews (www.annualreviews.org).

One process involves desensitization, defined as the “reduction in emotion-related physiological reactivity to real violence” (Carnagey, Anderson, & Bushman, 2007, p. 490; Chapter 18, this volume). Here, physiological reactivity refers to the magnitude of change in several indices of arousal (e.g., heart rate, skin conductance) when being exposed to real violence. It has been argued that desensitization is related to aggressive behavior because individuals will have less of a negative emotional and physiological reaction to seeing, thinking about, or planning real-life violence. Research has shown that exposure to violence in the media is related to desensitization (Bushman & Anderson, 2009; Carnagey et al., 2007). Therefore, continued violent media exposure is likely to be related to aggressive behavior because viewers may not be as emotionally or physiologically affected by real-life violence.

To test the desensitization hypothesis, Carnagey et al. (2007) had participants play either a violent or nonviolent videogame and measured their physiological arousal at baseline, after game play, and then after being exposed to film clips of real-life violence. The media violence/desensitization hypothesis predicts that participants who played the violent videogame should show less physiological reactivity to the film violence than those who had played a nonviolent game. This is exactly what was found (Carnagey et al., 2007). In a pair of follow-up experiments, Bushman and Anderson (2009) tested the relation between media violence exposure and the likelihood of helping a person in distress. Participants who had recently played a violent videogame or watched a violent movie were less helpful than those who had just played a nonviolent videogame or watched a nonviolent movie.

Other studies have examined how desensitization is related to aggressive behavior. For example, Bartholow, Benjamin, and Sestir (2006) found that the relation between media violence exposure and aggressive behavior was mediated by physiological desensitization, suggesting that desensitization is one process by which media violence is related to aggressive behavior.

Another long-term process involves the development of aggressive attitudes and beliefs. GAM predicts that positive attitudes and beliefs towards violence should be related to the development of one’s aggressive personality. GAM argues that these positive attitudes and beliefs regarding aggressive behavior are formed when an aggressive behavior is positively reinforced (see Bandura, 1965). There are numerous studies showing such effects. In the videogame domain, Anderson et al. (2004) found that videogame violence exposure was positively related to positive attitudes towards violence, and that the relation between violent videogame exposure and aggressive behavior decreased substantially (sometimes to nonsignificance) when positive attitudes towards violence were entered into the model. Longitudinal evidence found that exposure to violent videogames significantly predicted normative beliefs about aggression 30 months later, and that these aggressive beliefs were significantly related to subsequent physical aggression (Moller & Krahe, 2009). This provides support for the hypothesis that positive attitudes towards violence at least partially mediate the relation between violent videogame exposure and aggressive behavior.

Another process is formation of aggressive behavioral scripts (see next section for a discussion of script theory). Behavioral scripts are a specific type of knowledge structure represented in one's memory. Scripts are defined as mental representations of how the flow of events should occur in a given social situation (Abelson, 1981). Behavioral scripts guide behavior because they help cognitively map how one is to act. Related to aggression, behavioral scripts help dictate when and how one should aggress in certain social situations. In which situations these aggressive behavioral scripts may be utilized depends partially on the individual and what scripts are encoded. At a theoretical level, individuals who are continually exposed to real-life or media violence should have readily accessible aggressive behavioral scripts that are automatic and fairly retrievable, while those who have viewed less violence should have fewer aggressive behavioral scripts accessible, and the scripts that exist may not be as automatically retrieved. Indeed, research shows that short-term exposure to violent videogames increases the accessibility of aggressive scripts (e.g., Bushman & Anderson, 2002), and long-term exposure is related to hostile attribution biases (Anderson, Gentile, & Buckley, 2007).

Another long-term process is the development of aggressive perceptual schema. Perceptual schema are a type of knowledge structure that can be used to identify simple everyday objects, such as a computer, but also complex social events, such as a provocation (Anderson & Carnagey, 2004). These types of knowledge structures contain nodes, or concepts in semantic memory. Adapted from cognitive neo-associative theory (see next section), aggressive concepts with similar meanings (e.g., kill, murder) and concepts that are repeatedly paired with one another (e.g., knife, stab) become strongly linked in semantic memory. Priming one node of a well-developed associative network increases the likelihood that other nodes of that network will be activated. Research by Anderson, Benjamin, and Bartholow (1998) showed that after being primed with pictures of aggression-related items (e.g., guns), participants had faster response times to similar aggressive words, such as "injure," compared to control words, such as "survey," and compared to trials with nonaggression related picture-primers (e.g., plants).

Anderson et al. (2004) more directly tested the hypothesis that brief exposure to a violent videogame primes aggressive thoughts. In Experiment 1, participants played either a violent or a nonviolent videogame, then did a word completion task that involved making words from word fragments. As expected, those who had just played a violent game were more likely to create aggression-related words than those who had played a nonviolent game. These studies show that brief exposure to violent media images (e.g., guns) prime aggressive perceptual schema.

Distal evidence for the relation between media violence exposure and aggressive perceptual schema was found by Anderson et al.'s longitudinal study (2007, Study 3). Violent videogame exposure and hostile attribution bias (the tendency to perceive ambiguous acts as hostile; see Orobio de Castro, Veerman, Koops, Bosch, & Monshouwer, 2002) of elementary school children were assessed at two points during

a school year separated by about six months. Repeated exposure to violent games predicted increases in hostile attribution bias, a type of aggressive perceptual schema.

Using a very different paradigm, Uhlmann and Swanson (2004) showed proximate evidence for the relation between media violence exposure (i.e., violent videogame exposure) and aggressive perceptual schema. Uhlmann and Swanson (2004) showed that high exposure to violent videogames among college students was associated with highly accessible aggressive self-images. Thus, violent videogames appear to create aggression-related knowledge structures of various types developmentally (distally; Anderson et al., 2007), and such games activate these knowledge structures when they are played (proximally; Uhlmann & Swanson, 2004).

GAM is Integrative

A strength of GAM is its ability to explain how myriad short- and long-term variables and processes are related to aggressive behavior. GAM has such explanatory power because it was derived from a number of other, more specific, aggression theories. Thus, GAM is an integrative model of aggression theories. Several of the theories that were influential to GAM will be discussed.

Cognitive Neo-Associative Theory

Berkowitz's (1984, 1993) cognitive neo-associative theory posits that specific emotional states and memories are represented as nodes in semantic memory (see Chapter 10, this volume). Once any node becomes activated, other related nodes become activated forming an associative network through a process called spreading activation. Berkowitz's model posits that after a provocation, for example, individuals experience negative affect, which activates at least two associative networks. The first network is the aggression-related tendencies network, in which aggressive thoughts and memories become activated, along with expressive motor responses related to aggression, and physiological arousal. After activation of this network, the aggressive thoughts and memories will activate feelings of anger. The second network is the escape-related tendencies network, which consists of thoughts and memories related to feeling fear, along with the strong physiological reaction to fear, and gross motor responses to being afraid. Once these networks are active, the result is the affective consequence of fear. Both of these routes then proceed to the next step of analysis, which consists of higher-order processing. The end result is a behavior that is either anger-related (for the aggression route) or fear-related (for the escape route).

Excitation Transfer Theory

Zillmann's (1971) excitation transfer theory posits that aggressive behavior can be explained by the arousal produced from any stimuli, including the media. The physiological arousal experienced from the media may carry over to another task, because such arousal may not decay quickly. Therefore, the physiological arousal present at the second task is a composite of any physiological arousal created by the second task and the residual arousal experienced by the first task (Zillmann, 1971). If the first and second tasks are close in time, and the second task is related to anger (e.g., a provocation), then that anger may be exaggerated and aggressive behavior may be more likely to occur (Zillmann, 1983). Research has shown that violent media exposure is related to more of a physiological arousal response than nonviolent media exposure (see Bushman & Huesmann, 2006), and excitation transfer theory would predict that the arousal produced by violent media will increase the probability of aggressive behavior during a subsequent interaction, especially if the second interaction or task involves an individual being provoked.

Social Learning Theory

Another important theory that influenced GAM is Bandura's social learning theory and the later version known as social cognitive theory (Bandura, 1978; Chapter 10, this volume). This theory discusses the development of an aggressive personality via myriad methods of learning that can account for individual differences in aggressive personalities. Social learning theory posits that observational learning and reinforced performance form the origins of aggression. Bandura (1978) argued that media violence exposure is related to aggressive behavior, because children are taught aggressive styles, the media shape images of and beliefs about reality, the media desensitize, and the media alter restraint over behavior. Continued observation and learning of aggressive behaviors may also be related to the development of aggressive beliefs that are likely to influence how one interprets social situations.

Script Theory

Huesmann's (1986) script theory posits that people decide to behave aggressively due to their programs of behavior (behavioral scripts) that are stored in memory. Huesmann (1988) argued that both observational learning and enactive learning are two processes by which scripts are encoded in memory. During learning, individuals will often pay attention to the salient cues and scenes in the environment. The information from these scenes, along with one's current mood and memory, help to evaluate the appropriateness of the behavior just observed. If the observed behavior

is positively reinforced (Bandura, 1965), then that behavior is likely to be evaluated as appropriate, and encoded in memory for later retrieval and used as a guide. If a behavioral script gets retrieved from memory, it is evaluated in terms of how socially appropriate the behavior is and how desirable the individual's goals are. If the evaluation of the behavioral script is deemed appropriate, that script gets retrieved and enacted. If the behavior is deemed inappropriate, then memory is searched for a more appropriate script. The mass media is one method by which individuals can observationally learn behavioral scripts, and determine what situations are acceptable for the use of these scripts.

Social Information Processing

Crick and Dodge's (1994) social information processing theory (SIP) posits that all individuals enter a social situation with a database of memories, schema, knowledge about other situations, and social norms regarding appropriate behavior. SIP posits that individuals will encode and then interpret the social situation. Once the cues are interpreted, goals are clarified regarding possible behavior. Appropriate behavior is then accessed from memory, often relying on behavioral scripts from the database. This response is then evaluated in terms of the appropriateness of the behavior (see Fontaine & Dodge, 2006 for specific factors that are important at this step). If the behavior is deemed appropriate, then behavior is enacted. If the behavior is evaluated as inappropriate, another response is generated and evaluated.

Role of Individual Differences

Individual differences, or factors related to the personality, have been shown to be related to aggressive behavior. GAM incorporates these individual differences into its theorizing in short-term and long-term processes. Examples of three individual difference variables will be discussed: hostile attribution bias, age, and sex.

Hostile Attribution Bias

A hostile attribution bias is the tendency to perceive ambiguous acts as hostile (see Orobio de Castro et al., 2002). This type of bias may influence attributions of intent in another's behavior in the short-term, and may influence the ease and development of accessibility of aggression-related knowledge structures in more distal processes. In longitudinal media violence research, Anderson and his colleagues (Anderson et al., 2007, 2008) found that hostile attribution bias acts as a partial mediator between violent media exposure and aggressive behavior four to five months later. Violent

acts in the media are often portrayed as an acceptable method of conflict resolution. Exposure to this type of content is a learning trial and continued exposure is likely to be related to the development of aggressive behavioral scripts through learning processes. For violent media viewers, the default response to another's ambiguous but harmful behavior (e.g., getting bumped in the lunch line) may be to attribute it as having hostile intent. This often increases the likelihood of aggressive behavior.

Age

Positive relations between media violence exposure and aggressive behavior have been found for adult (e.g., Bartholow, Sestir, & Davis, 2005) and child (e.g., Hoph, Huber, & Weib, 2008) samples. There is theoretical reason to expect age differences in the processes governing aggressive responding after viewing violent media. Bushman and Huesmann (2006) argued that after media violence exposure, adults are likely to act aggressively because of the activation and retrieval of very well-developed aggressive behavioral scripts. Children, on the other hand, are less likely to have these aggressive scripts readily available to guide behavior, because children should have been exposed to less violence. They argued that children will respond aggressively after viewing violent media because of imitation processes. Early research from Bandura (1965) found that children behaved more aggressively after viewing an aggressive model that was positively reinforced for his/her behavior. This suggests that both children and adults are likely to behave aggressively after exposure to violent media; however, the processes that delineate why this relation exists might differ. More likely, both types of process operate on both children and adults, with priming processes being relatively more predominant among adults, and imitative processes more predominant among young children.

Sex

Meta-analytic reviews have found that males are more physically aggressive than females (e.g., Card, Stucky, Sawalani, & Little et al., 2008). Therefore, sex may moderate the relation between violent media exposure and aggression. In their review, Anderson et al. (2003) cited evidence to suggest that males and females tend to have similar effect sizes in the relation between media violence exposure and aggressive behavior. Some empirical evidence suggests that males who played a violent video-game tend to be more aggressive than females who played the same game (Bartholow & Anderson, 2002). One possible explanation for sex differences is that male media characters tend to be more physically violent than female media characters (Anderson et al., 2003). Another explanation is that males tend to seek out media violence more than females, and research has shown that, on average, males play more violent videogames than females (Moller & Krahe, 2009). Whatever the reason, when effect

sizes from the videogame violence and aggression literature were synthesized, results showed no significant differences in effect size estimates between males and females after exposure to videogame violence, a result recently confirmed in a new meta-analysis of the violent videogame literature (Anderson et al., 2010).

General Learning Model

Not all mass media depict violent behavior. Depending on their content, the media can also teach audiences about gender roles, aggressive behavior, prosocial behavior, and a host of other social relations. Broader theories have been posited to predict when exposure to any media content will be related to its behavioral depiction. The general learning model (GLM; Buckley & Anderson, 2006; Gentile et al., 2009, Swing & Anderson, 2008) is a recent attempt to broaden the relevance of the social-cognitive and developmental insights of GAM beyond the domain of aggression. If the postulations of GAM are correct, then certain media effects can also be explained by a more general learning theory. The overlap between GLM's and GAM's predictions on the relation between media violence exposure and aggressive behavior provide substantial support for GLM. However, there is a paucity of evidence that can uniquely explain the postulates of GLM. One area of research that can be predicted from GLM, but not GAM, is the relation between prosocial media viewing and prosocial behavior.

Like GAM, there are distal and proximate processes within GLM. The processes involved in the proximate GLM are similar to GAM. Situational and personality input factors predict one's internal state (consisting of interrelated cognitions, affect, and physiological arousal). These internal state variables influence one's appraisal and decision processes, which influence behavior. The behavioral response feeds back into the dynamic situational input factor at the start of GLM.

The distal GLM (see Figure 4.3) posits that repeated learning and practice with any media is a learning trial that is related to the formation of three different, but highly related, processes. One process is the development of precognitive and cognitive constructs. Examples of such constructs include expectation and perceptual schema, beliefs, and behavioral scripts. Another process is the development of cognitive-emotional constructs, which include attitudes and stereotypes. A third process is the development of emotional constructs, which may include conditioned emotions and affective traits. These constructs have been predicted to be related to the development of or changes in one's personality (Gentile et al., 2009).

GLM can predict how any media portrayal can be related to "media-trained behavior," including aggression. However, the majority of work *uniquely* testing GLM has come from research examining the relation between prosocial media exposure and prosocial behavior. Indeed, the theoretical foundations for GLM were derived from early research testing the postulates of GAM as well as research testing the relations

Figure 4.3 The general learning model. From D. A. Gentile, C. A. Anderson, S. Yukawa, N. Ihori, M. Saleem, L. K. Ming, et al. (2009). The effects of prosocial video games on prosocial behaviors: International evidence from correlational, experimental, and longitudinal studies. *Personality and Social Psychology Bulletin*, 35, 752–763.

between prosocial media exposure and prosocial behavior. Although much empirical work has tested such relations, early research on prosocial game effects has been mixed. For instance, Chambers and Ascione (1987) found that prosocial videogame exposure was unrelated to prosocial behavior; however, the prosocial videogame used in their study did not depict many prosocial acts. Conversely, Liss, Reinhardt, and Fredriksen (1983) found that children exposed to a prosocial cartoon helped a fictitious partner significantly more than children who viewed either an aggressive cartoon or a cartoon that depicted aggressive behaviors to accomplish a prosocial goal. Despite the wealth of research in this area, there are apparent inconsistencies in the early literature, but recent empirical work has shed light on both the distal and proximate processes in GLM.

Support for distal processes in GLM would show that continued exposure to prosocial media is related to variables associated with prosocial personality tendencies, such as the likelihood of prosocial behavior, empathy, and cooperation. These

predictions were supported by a series of studies conducted by Gentile and his colleagues (2009). First, correlational findings showed significant relations between prosocial videogame exposure and helping behavior, cooperation, sharing, and empathy (Study 1). Second, a longitudinal study showed that prosocial videogame exposure significantly predicted prosocial behavior four to five months later, even after statistically controlling for other relevant variables (Study 2).

Support for the proximate processes in GLM would show that viewing prosocial media would predict the likelihood of prosocial behavior compared to viewing other (e.g., non-prosocial) media in the short-term. Support for this hypothesis was found by Gentile et al. (2009, Study 3) who had college-aged participants play either prosocial videogames, neutral videogames, or violent videogames and then complete a behavioral measure that afforded participants the ability to engage in prosocial and/or aggressive behavior. Results showed that playing prosocial videogames was related to more prosocial behavior compared to the other two game types. Also, playing the violent videogame was related to more aggressive behavior compared to the other two game types. Additional evidence from the videogame domain found a decreased number of aggressive cognitions after playing a prosocial videogame compared to a neutral videogame (Greitemeyer & Osswald, 2009).

Prosocial musical lyrics have also been found to be related to prosocial behavior, supporting the short-term processes in GLM. Greitemeyer (2009a) found that participants who listened to prosocial song lyrics had significantly higher accessibility to prosocial thoughts, higher levels of state empathy, and behaved more prosocially (donating money to a charity) compared to participants who listened to neutral song lyrics. Furthermore, Greitemeyer (2009b) found that participants who listened to prosocial song lyrics (compared to neutral song lyrics) had higher levels of prosocial behavior (picking up pencils and assisting in future laboratory studies), which was mediated by empathy, rather than prosocial thought accessibility. This supports GLM but also suggests that the affective processing route may be the most influential route in predicting short-term prosocial media effects on prosocial behavior; however, more work and replication is needed to support this claim.

Overall Conclusions

In this chapter we have discussed research on the relation between exposure to mass media content and behavior. In doing so, we have elaborated on the general aggression model, and we have elucidated how, why, and for whom media violence exposure is likely to be related to aggressive behavior. Second, we briefly discussed the general learning model, which is, in itself, a direct generalization of GAM. GLM has the power to predict many of the behavioral effects that the mass media shape, including aggressive and prosocial behaviors. Both of these models were discussed in terms of their proximate, short-term relations between the mass media exposure

and behavior, but also their longer, distal processes regarding the learning, development, and retrieval of several highly related knowledge structures that result from continued media exposure and that are instrumental in understanding long-term media effects.

Despite the wealth of evidence for the relation between mass media exposure and behavior, we believe that more work is needed. For instance, more high-quality longitudinal research is needed to test the relation between media violence exposure, various mediating variables, and aggressive behavior. Although accruing longitudinal evidence has become available (Anderson et al., 2007; Anderson et al., 2008, Hoph et al., 2008; Moller & Krahe, 2009), more work and replication are needed to determine more precisely how media violence exposure is related to aggressive behaviors years later. Also, we believe that focus on the effects of prosocial media exposure deserves increased empirical attention. Although recent evidence suggests that prosocial media exposure is related to prosocial behavior (Gentile et al., 2009; Greitemeyer, 2009a; Greitemeyer & Osswald, 2009), more work is needed to test for additional moderators and mediators in this relationship.

One research area that needs continued empirical attention, and that would test the postulates of both GAM and GLM, is the relation between exposure to relationally aggressive media depictions and relational aggression, defined as "harming others through purposeful manipulation and damage of their relationships" (Crick & Grotpeter, 1995, p. 711). Relational aggression is important to study because it may capture gender-related aggression tendencies. Research has shown that exposure to relationally aggressive media is related to subsequent relational aggression, but also to subsequent physical aggression (Coyne et al., 2008). Coyne et al. (2008) suggested that this provides support for GAM (and thus GLM), but also supports a crossover effect, such that viewing one type of aggressive behaviors in the media may generalize to other forms of aggressive behaviors.

Mass media are not inherently good or bad, but people learn and content matters (Gentile et al., 2009). What the media portray and teach is likely to determine what attitudes, beliefs, and behavior(s) get learned. Research has shown, and theoretical models predict, that violent content is related to aggressive behavior and prosocial content is related to prosocial behavior through such learning processes.

Uses and Gratifications

A Social and Psychological Perspective of Media Use and Effects

Paul Haridakis

ABSTRACT

For several decades uses and gratifications (U&G) has been a predominant theory guiding research on media use and effects. U&G emphasizes the centrality of the individual in the audience–media use–effects relationship. Research guided by this audience-centered perspective has suggested that understanding media effects requires consideration of audience members' individual differences, expectations, goals, level of purposiveness and activity when using media to satisfy their needs and desires. Though much U&G research has focused on how and why people use media, it is, ultimately, a media-effects theory. In this chapter, I review the theory's origins, evolution, and application in the study of media effects. Finally, I discuss the social significance and new and enduring directions of U&G research in the study of newer media environments in which people have a growing number of media choices for consuming, sharing and creating media fare; and connecting with each other.

Introduction

Uses and gratifications is an audience-centered media-effects perspective. It stresses that media effects are the result of a confluence of factors working in concert, and that many of these factors are unique to the individual. Uses and gratifications

The International Encyclopedia of Media Studies, First Edition.

suggests that people's social and psychological characteristics influence their needs and desires which are manifested in their motives for using communication channels. Audience background characteristics and motives, in turn, influence media-use activity before, during and after use; attitudes about the media and their content; and, ultimately, effects.

Although uses and gratifications sees people as purposive, goal directed, and motivated in seeking to satisfy their needs and desires, it also recognizes that many effects – perhaps most – are unintended (Katz, Blumler, & Gurevitch 1974). Thus, researchers have used the perspective to explore consequences of media use other than gratifications sought to be obtained, including unintended or even detrimental outcomes of media use such as viewer aggression (Haridakis, 2002), media addiction (Kim & Haridakis, 2009), unintended perceptions gleaned from the media (Rubin, Haridakis, Hullman, Sun, Chikombero, & Pornsakulvanic, 2003), and a host of other outcomes.

But, on the whole, uses and gratifications suggests people choose media that they feel satisfies their needs. They develop expectations of media and rely on media and content that meet those expectations.

Origins and Theoretical Assumptions

Reviews of audience-centered perspectives often trace the roots of uses and gratifications to mid-twentieth century research in which scholars began to focus more deliberately on the functions media serve for people, such as surveillance, cultural transmission, entertainment and mobilization (Rubin, 2009). In early research, scholars identified reasons for which people used particular media and fare such as radio music (Suchman, 1942), radio quiz shows and serials (Herzog, 1940, 1944), newspapers (Berelson, 1949), comics (Wolfe & Fiske, 1949), and television (Horton & Wohl, 1956). Scholars came to recognize that media effects were attributable to more than simple exposure to media or their content, and that researchers needed to focus on learning more about why and how people use the media. Such a research orientation was referred to by various names including functional (Wright, 1960), phenomenistic (Klapper, 1960), and situational (Freidson, 1953). Katz (1959) referred to such an approach as uses and gratifications.

Klapper (1960) synthesized much of this research and concluded that individuals' psychological and social environmental differences, including group membership, interpersonal communication, and media use behaviors (e.g., selective exposure, perception, and retention) mediated the effects of media exposure. Much of the research reviewed by Klapper was more descriptive than explanatory. But, it did reflect the growing recognition of the need to account for individual-level and media-use differences in the study of media effects. This included the influence of audience activity (Blumler, 1979), media-use motives (McQuail, Blumler, & Brown, 1972), and background characteristics such as race (Gerson, 1966), personality, and social situation (Rosengren, 1974).

The uses and gratifications perspective that emerged from such research represented a theory of social and psychological needs that was lacking in mass communication research (Katz, Blumler, & Gurevitch, 1973–1974). Katz et al. (1974) summarized the perspectives' assumptions, and the breadth and scope of its application. They outlined the often-cited model of uses and gratifications that addresses

(1) the social and psychological origins of (2) needs, which generate (3) expectations of (4) the mass media or other sources, which lead to (5) differential patterns of media exposure (or engagement in other activities), resulting in (6) need gratifications and (7) other consequences, perhaps mostly unintended ones. (p. 20)

This audience-centered model saw the media consumer as active, selective, and relatively goal-directed. While acknowledging that some media use is more casual and passive, purely involuntary, unconscious, and impulsive media use was largely outside the boundaries of the focus of uses and gratifications.

Since the 1970s, scholars have tested the assumptions of the uses and gratifications model outlined by Katz et al. (1974). They have focused on clarifying the conceptualization and operationalization of concepts central to the theory, and sought empirical verification of links among these concepts as they have applied the theory to study the use and effects of various media and content.

Rubin (2009) recently described five central assumptions of uses and gratifications. First, "Communication behavior, including the selection and use of the media, is goal directed, purposive, and motivated," and functional. Second, people "are variably active" in their "selection and use of communication" and "use media to satisfy felt needs or desires." Third, "Social and psychological factors guide, filter, or mediate behavior." Fourth, "media compete with other forms of communication – or, functional alternatives – such as interpersonal interaction for selection, attention, and use." Fifth, "People are typically more influential than the media in this process, but not always" (p. 167).

In sum, uses and gratifications theory addresses media use and effects as a process that begins with the individual's needs and desires which drive him/her to use communication to satisfy those needs and desires and ends in media effects, both intended and unintended. It recognizes that need satisfaction and other media effects vary based on a host of individual differences such as personality, social relationships, potential for interaction, availability of preferred and alternative media and interpersonal communication channels, motives for using media, and how actively media are used.

Evolution of Research

Over the years different studies have focused on different parts of the uses and gratifications (U&G) model outlined by Katz et al. (1974). Rubin's (2009) update reflects a

contemporary U&G model accounting for research that has refined and clarified the perspective's central tenets. Some research has focused on motives for using media and interpersonal communication. Some research has focused on understanding the variability of audience activity and/or linked motives to activity. Other research has focused on how one's social/psychological circumstances influence motives, selectivity, and/or other forms of audience activity (e.g., involvement, attention).

In still other studies, researchers have attempted to test assumptions of the whole U&G model. These types of studies typically focus on how audience background characteristics relevant to the subject of interest (e.g., medium, content, or specific media effect), media-use motives, and activity (e.g., selectivity, involvement, attention) work together to influence attitudinal or behavioral media effects.

Due to the breadth and volume of uses and gratifications research studies, available space only allows for a very abbreviated review of research conducted. It is my hope, however, that the representative review provided here will give the interested reader a flavor of the wider body of U&G scholarship of which the examples here are illustrative.

Communication Motives

The importance of audience motivation in U&G research cannot be overstated. Rosengren (1974) asserted that although U&G posits that needs drive human communication behavior, exploration of fundamental human needs is best left for biologists and psychologists. He stressed that uses and gratifications researchers concentrate their attention on communication motives in which needs are assumed to be manifested (e.g., an underlying need for human interaction may be manifested in motives such as seeking companionship or affection). Katz et al. (1974) suggested that researchers should, in fact, avoid conclusions about the cultural significance of a medium or media content until motives were fully understood. Accordingly, one important research direction beginning in earnest in the 1970s was the identification and conceptualization of media-use motives (e.g., McQuail et al., 1972).

One important advancement was the development of motive indexes that could be used to operationalize motives in empirical research. Greenberg (1974) developed an index to measure motives British children had for watching television. This research was extended by Rubin (1981, 1983). Rubin's efforts resulted in the 27-item television-viewing motive index. It measured nine specific motives for watching television: relaxation, companionship, habit, to pass the time, entertainment, social interaction, information, arousal, and escape. Greenberg's and Rubin's indexes have been used in various iterations over the years to study motives for watching television and specific television genres (see Perse, 2004).

Scholars have remained devoted to the exploration of motives in an effort to understand and explain the use of a variety of media and media fare. Examples of

contemporary research include the study of motives for using/watching news programs (Perse, 1990), soap operas (Rubin & Perse, 1987a), sports (Earnhardt & Haridakis, 2008), televised violence (Haridakis, 2002), TV talk shows (Rubin, Haridakis, and Eyal, 2003), reality shows (Barton, 2009), public television (Palmgreen & Rayburn, 1979), religious programs (Abelman, 1987), erotica (Perse, 1994), movies (Johnston, 1995), radio talk shows (Armstrong & Rubin, 1989), satellite radio (Lin, 2006), VCRs (Rubin & Bantz, 1987), the telephone (Dimmick, Sikand, & Patterson, 1994), cell phones (Leung & Wei, 2000), iPods (Ferguson, Greer, & Reardon, 2007), the Internet (Papacharissi & Rubin, 2000), Internet content such as political fare (Kaye & Johnson, 2002), Internet sites such as home pages and social networks (Haridakis & Hanson, 2009; Papacharissi, 2002), fantasy sports (Spinda & Haridakis, 2008), and interpersonal communication (Rubin, Perse, & Barbato, 1988).

Together, studies suggest that there are some rather stable motives for using a variety of media and media content (e.g., information, entertainment, relaxation, escape, and to pass the time). On the other hand, research has identified motives unique to selecting or preferring a particular medium or content. For example, Johnston (1995) found unique motives for watching graphic horror movies (e.g., gore watching, thrill watching). Similarly, Perse (1994) reported four motives for using erotica: sexual enhancement, diversion, sexual release, and substitution for a sexual partner. Motives for watching sports have included reasons such as achievement, aesthetics, and physical attraction to athletes, among others (Trail & James, 2001).

The difficulty of accounting for all possible motives for using specific media or fare is exacerbated in newer media environments in which people can use a growing number of media for multiple or unique purposes. For example, people may use DVDs and VCRs to watch their favorite television programs, but may choose these technologies over television because they permit them to watch the programs on-demand (e.g., Rubin & Bantz, 1987). The same time-shifting advantage occurs with DVRs (digital video recorders) such as TiVo, and video sharing sites such as YouTube (Haridakis & Hanson, 2009). People may use the Internet for some of the same reasons they use older media, and also because of its convenience (Hanson & Haridakis, 2008). And, people may prefer media such as cell phones because of their mobility (e.g., Leung & Wei, 2000).

At the same time, there may be differences between using the Internet for media consumption (e.g., listening to music, watching videos, acquiring information) and using the Internet to share information with others (Haridakis & Hanson, 2009). Similarly, although cell phones may be used primarily for interpersonal communication, they also may be used for status- or fashion-related reasons, and because of their immediacy (Leung & Wei, 2000). In addition, users' motives may differ depending on who they are talking to (e.g., immediate family members vs. business associates) (Leung & Wei, 2000).

One area of research that has been growing in particular is the study of motives for using online media for social and interpersonal interaction. Over 20 years ago

Rubin and Rubin (1985) argued that people can choose media to satisfy interpersonal needs and can choose interpersonal channels to gratify media-related needs. Newer media environments have provided researchers with interesting new opportunities to explore this observation. U&G researchers have noted that the Internet, for example, is used for both interpersonal and media-related reasons (e.g., Pornsakulvanich, Haridakis, & Rubin, 2008). Such findings prompted Haridakis and Hanson (2009) to suggest that there probably always has been a false dichotomy between media-use motives and interpersonal communication motives (p. 322). For example, teenagers watching a movie together or a family playing games on the Wii are most likely satisfying both interpersonal and media-related desires.

Today, researchers seldom examine the role of motives without considering their relationship with other important concepts with which they should be related, theoretically. One particularly important theoretical development in U&G inquiry was identifying the relationship between audience activity and motives for using media.

Activity

Because U&G posits “[c]ommunication behavior, including the selection and use of the media, is goal-directed, purposive, and motivated” (Rubin, 2009, p. 167), a central tenet of the perspective is that people are active media users and that their activity level is influenced by their motives for using media. Over the years scholars have come to regard activity as a variable concept. That is, people are more or less active at different times. Activity also is manifested in different ways, such as in intentionality, selectivity, attention, cognitive and emotional involvement with media or media fare, and use of the fare consumed. Activity also occurs at different times in the media-use process – before exposure (e.g., pre-exposure planning), during exposure (e.g., involvement, attention) and after exposure (e.g., thinking/talking about the fare consumed) (Levy & Windahl, 1984).

Finding patterns of relationships among motives and different types of audience activity led researchers to suggest that there are different orientations toward media use. Various bipolar terms have been used to describe these different media-use orientations. For example, media use has been classified broadly as proactive or passive (Finn, 1992), instrumental or ritualized (Rubin, 1983), and as utilitarian or diversionary (Perse, 1990).

Regardless of the terms that have been attached to these different orientations, each suggests media use rests on a continuum from more passive to more active. According to Rubin and Perse (1987b), “these are general orientations toward a medium and its content, not static or discrete characteristics of individual users” (p. 59). They reflect the multivariate relationship among motives, attitudes, and behaviors. Rubin (2009) explained,

Ritualized use is using a medium more habitually to consume time and for diversion. It entails greater exposure to and affinity with the *medium*. Ritualized use suggests utility but an otherwise less active or less goal-directed state. *Instrumental* use is seeking certain message *content* for informational reasons. It entails greater exposure to news and informational content and perceiving that content to be realistic. Instrumental use is active and purposive. It suggests utility, intention, selectivity, and involvement. (pp. 172–173)

Thus, some motives such as surveillance and information seeking reflect more instrumental use, whereas using media out of habit or to pass the time reflect more passive use. But, again, these are just broad generalizations that depend on the interrelationships among motives, attitudes, and activity levels. For example, using media habitually to escape may indeed reflect more ritualized use. But, if someone is using media or media content purposively to escape, then for that person at that point in time it may reflect more instrumental use. Kim and Haridakis (2009) speculated as much when they found that using the Internet to escape predicted a dimension of Internet addiction they termed “escaping reality.”

In short, the variability of activity depends on factors such as motives, attitudes, perceptions, and expectations of media and content. It also can be affected by social context in which media use occurs and the media consumer’s social situation, such as the availability of media and other communication channels from which to choose (Rubin, 2009).

The relative degree of activity may also be fostered or inhibited by the medium selected. Different media permit different levels of activity and/or interactivity. For example, certain media forms like talk radio, call-in TV like home shopping, and particular Internet functions (e.g., social networking sites) are specifically designed for interactive use. This inherent interactivity has provided researchers with new opportunities to flesh out the conceptualization and role of media user activity. It also, however, has raised new challenges not posed by the use of older less interactive media, because today media users are not just receivers of media fare. They also are content senders/sharers and creators.

Therefore, researchers have been applying U&G to examine different activities associated with receiving, sharing, or creating media fare. Consistent with U&G assumptions, research has suggested that people’s background characteristics and motives influence their media-use activities, whether they are consuming, sharing, or creating content. For example, in a study of personal home pages, Papacharissi (2002) found that social interaction-reward (how satisfying one found their face-to-face communication with others to be) was a positive predictor and life satisfaction was a negative predictor of home page expressiveness. Years of Internet use and number of years of web authoring were positive predictors of home page creativity, and years of computer use was a negative predictor of creativity. Not surprisingly, self-expression motivation predicted home page expressiveness and the amount of personal information included. Haridakis and Hanson (2009) found that male gender

and one's level of social activity were two background characteristics that predicted viewing YouTube videos, and social activity and internal locus of control (belief that one can control events in one's life) were characteristics that predicted sharing videos. Users also shared videos for entertainment, to coview with others, and for social interaction with others.

Media and Content Exposure

Uses and gratifications is a media-effects perspective. Because there can be no media use or effects without exposure, U&G researchers typically assess exposure to a medium or content in order to study its selection, use, or effects. Often, exposure is measured by asking respondents questions regarding the amount of time they spend with media or content or the frequency of use (e.g., Haridakis, 2002; Haridakis & Hanson, 2009).

However, the U&G theoretical framework places less emphasis on the effects of sheer exposure than it does on the effects of audience activity during exposure. Therefore, U&G studies often couple or replace measures of exposure with measures of one or more types of audience activity such as selectivity, media and content preferences, level of attention, and involvement with content.

Another exposure-related theoretical concept sometimes considered in U&G studies is the notion of functional alternatives. U&G suggests that people are most likely to choose the communication channel they feel will most ably satisfy their needs or desires. Sometimes, however, the preferred medium is not available. Thus, they turn to other communication channels, or "functional alternatives" (Rosengren & Windahl, 1972).

Use of an alternative channel is functional when it can be used in-lieu of another channel to satisfy a felt need or desire. For example, Rubin and Rubin (1985) suggested that media at times can be used to satisfy interpersonal needs. Pornsakulvanich et al. (2008) recently corroborated this when they found that the Internet was used to foster relationship closeness. Papacharissi and Rubin (2000) found that those who were anxious when communicating face to face, and found it less than rewarding, tended to turn to the Internet for interpersonal utility. In addition to the Internet, technologies such as the cell phone can be used to stay in touch with friends, family and associates (Leung & Wei, 2000).

Sometimes, though, selection of alternative media may be dysfunctional, such as when it has unexpected negative consequences. As Klapper (1963) noted nearly 50 years ago, "what may be functional for one sort of person may serve no function, or may be dysfunctional, for another sort of person" (p. 521). For example, researchers have speculated that too much reliance on television or the Internet may result in addiction to the medium (Finn, 1992; Kim & Haridakis, 2009). Similarly, during a crisis people may turn to the media for political information,

but may be more fearful than those who use the media for other reasons (e.g., Haridakis & Rubin, 2005).

Thus, in a U&G framework, there are a number of considerations in addition to sheer exposure. Media and content exposure is nonetheless important to measure, in order to understand what is selected, why and how it is used, and the effects it has. Making the latter determination requires consideration of media users' social and psychological background characteristics, which U&G suggests drive human communication behavior.

Background Characteristics

Uses and gratifications posits that "the selection of media and content, and the uses to which they are put, are considerably influenced by social role and psychological predisposition" (Katz, Gurevitch, & Haas, 1973, p. 165). Various types of media users' characteristics have been linked with communication motives, media and content choice or preferences, attitudes toward media, and media effects. Researchers have examined the influence of demographic and social factors. Examples include race, gender, nationality/ethnicity, life position, availability of communication channels such as interpersonal interaction, social situation in which media use occurs (e.g., covieing with others), and a host of psychological factors such as various personality traits, dispositions, and attitudes toward the respective media or content (see Papacharissi, 2009; Rubin, 2009).

Of course, not all social and psychological characteristics can be accounted for in an individual study. Therefore, typically, U&G research focuses on characteristics relevant to the particular subject of interest in a study. For example, a study of media violence may take into account audience characteristics that have been or theoretically should be linked to the use, motives for using, preference for, or effects of media violence (Chapter 8, this volume). These may include factors such as disinhibition and experience with crime (Haridakis, 2002), sensation seeking and aggressiveness (Greene & Krcmar, 2005), neuroticism (Krcmar & Kean, 2005), and gender differences (Haridakis, 2006a).

A study of the use of media for interpersonal communication might account for factors such as unwillingness to communicate and loneliness (Pornsakulvanich et al., 2008). A study of sports media use might consider factors such as fandom and gender (Earnhardt & Haridakis, 2008), or racial differences (Bilyeu & Wann, 2002). A study of use of a newer medium might consider users' perceived self-efficacy with the medium (LaRose & Eastin, 2004). A study of political media use may consider factors such as interest in politics, trust in government, and political self-efficacy (Hanson, Haridakis, Cunningham, Sharma, & Ponder, 2010; Kaye & Johnson, 2002). A study of reality television programs that permit viewers to peek into participants' private lives may consider a viewer trait such as voyeurism (Baruh, 2009).

Across studies, social and psychological differences of media users have been found to be differentially related to motives, activity, attitudes, and media effects. Below are some representative examples illustrative of typical uses and gratifications studies.

Representative Uses and Gratifications Studies

The U&G premise that people use media to satisfy particular needs and desires has led to examinations of gratifications obtained from media use (e.g., Palmgreen, Wenner, & Rayburn, 1980). Over the years, though, researchers have applied the theory to study a host of media effects – both intended and unintended. What the studies have in common are consistent findings that various media effects are influenced by different social and background characteristics of media users, different manifestations of audience activity, use of different media and media fare, and various motives for using media – corroborating uses and gratifications assumptions.

Papacharissi (2009) suggested the term “effects” in uses and gratifications research must be employed “with care” (p. 141). Arguably one reason for such caution is that U&G researchers generally have not focused specifically on effects of media, but rather on effects attributable to how media are used. Thus, the theory often has been applied to examine and understand factors of media use (e.g., motivation, selectivity, audience activity) rather than effects, *per se*.

Motives and Media Selection/Use

Some research has focused on social and psychological antecedents to motivation and/or media use. For example, Finn and Gorr (1988) found that social support variables and self-esteem were positively related to watching television for mood management, and that social compensation motivation was positively related to loneliness and shyness. Perse and Rubin (1990) found that chronically lonely TV news viewers tended to watch the news to pass the time, and Roe and Minnebo (2007) found tensions within school and home social contexts were related to watching television for mood management. Weaver (2003) found that three personality traits – extraversion, psychoticism, and neuroticism – were differentially related to television viewing motives. Conway and Rubin (1991) found that viewer anxiety was related to viewing television to escape. Kaye and Johnson (2002) found users’ political self-efficacy predicted two motives – guidance and information/surveillance – for using the Internet for political information. More recently, Earnheardt and Haridakis (2008) found that sports fandom was positively related to viewing televised sports for entertaining relaxation and self-esteem/achievement motivation.

However, uses and gratifications researchers generally do not focus on motives as outcome variables. Rather, the perspective views motives as explanatory of media consumption, use, and effects. Accordingly, numerous studies have explored links between motives and/or audience background characteristics and selection of media/content, or other media-use activities and attitudes.

For example, Greenberg (1974) found that arousal viewing was related to watching adventure programs and violent programs. Rubin (1981) found that information viewers preferred talk shows, whereas arousal viewers preferred sports. He also found that viewing to pass the time correlated negatively with preference for news programs, and social viewing was negatively correlated with talk show preference. Rubin (1983) found interactions among viewing motives and viewing behaviors (e.g., program preferences and viewing levels) and attitudes (television affinity, and television realism). In a study of elderly television viewers, Rubin and Rubin (1982) found that companionship, escape, pass time, relaxation, arousal, and product advertising motives were associated with watching game shows and soap operas. Entertainment and information motivation was associated with watching news, talk shows, and documentary-magazine shows.

In addition to general television viewing, studies have focused on the influence of motives and/or background characteristics on consumption or preference for media content such as soap operas (Rubin & Perse, 1987a), news (Rubin & Perse, 1987b), sports (Earnhardt & Haridakis, 2008), erotica (Perse, 1994), reality TV (Papacharissi & Mendelson, 2007), religious television (Abelman, 1987), and violent fare (Haridakis, 2002), to name just a few.

For example, Rubin, Haridakis, and Eyal (2003) found that different motives and specific background characteristics predicted attraction to different television talk shows (e.g., Oprah Winfrey, Jerry Springer). Perse and Rubin (1990) found that watching TV news and soap operas more ritualistically was linked to chronic loneliness. Papacharissi and Mendelson (2007) found that viewers who were higher in external locus of control, less mobile, and had reduced levels of interpersonal interaction tended to watch reality shows for companionship and voyeuristic purposes. Baruh (2009) found that younger individuals and women were most likely to watch reality shows.

Some background characteristics and motives related to consuming violent media fare have included extraversion and neuroticism (Krcmar & Kean, 2005), sensation seeking, verbal aggressiveness, argumentativeness, instrumental androgyny (Greene & Krcmar, 2005), male gender, arousal, and the motivation to pass the time (Haridakis & Rubin, 2003). In a study of news consumption across mediated sources (i.e., comedy news, cable news, broadcast news, Internet news, hometown newspapers), Diddi and LaRose (2006) found that news habit strength predicted overall news consumption, and that surveillance and escapism motives were consistent predictors of consumption.

Researchers also have explored the influence of background characteristics and motives on the selection and use of numerous other media such as radio (Dominick,

1974), music genres (Delsing, Ter Bogt, Engels, & Meeus, 2008), the Internet (Papacharssi & Rubin, 2000), the telephone (Dimmick et al., 1994), cell phones (Leung & Wei, 2000) movies (Johnston, 1995), and iPods (Ferguson et al., 2007). Lin (2006) found channel selectivity, diversion and habit listening motives, and certain radio format preferences predicted interest in adopting satellite radio. Leung and Wei (2000) found that instrumental motives (instrumentality, immediacy, and mobility), affection/sociability motivation, and subscribing to enhanced cell phone services predicted cell phone use.

Recently, researchers have been studying the use of the Internet's social media functions. These studies have suggested that user background characteristics and motives influence not only consumption of media fare, but dissemination or production of media content as well. For example, Haridakis and Hanson (2009) found that socially active males who watched YouTube videos for information, entertainment, covieing with others, and social interaction watched the videos more often than did their counterparts. The latter three motives (along with internal locus of control and level of social activity) predicted sharing videos with others. Papacharissi (2002) found that people who hosted personal home pages did so for entertainment and information-related reasons, to communicate with friends and family, for self-expression, for professional development, and to pass the time. Focusing on content creation, Leung (2009) found that recognition needs and social needs drove the production of user-generated content.

Intended and Other Positive Media Effects

Although studies such as those above have corroborated uses and gratifications assumptions regarding the relationships among audience background characteristics, media-use motives, and media-use activity, perhaps the most comprehensive U&G research has focused on ascertaining how a combination of these variables representing different stages of the Uses and Gratifications Model work in concert to predict various media effects.

Because U&G assumes media use is purposive and goal-directed, U&G studies often have focused on, arguably, desired positive outcomes of media use. Examples include satisfaction with programs, content, or media (Papacharissi & Rubin, 2000; Perse & Rubin, 1988), liking of media fare consumed (Krcmar & Kean, 2005), knowledge (Vincent & Basil, 1997), perceptions of media utility (Perse & Dunn, 1998), parasocial interaction (sense of interpersonal connection) with media personae (Earnheardt & Haridakis, 2009; Haridakis, 2006b), connection with others (Pornsakulvanich et al., 2008), perceptions of psychological empowerment (Leung, 2009), and cross-cultural adaptation (Wang, Sun, & Haradak, 2009).

Together, the studies support assumptions that background characteristics as well as various motives or a combination of motives and audience activity levels reflective of instrumental and ritualized media-use orientations influence many desirable

media effects. For example, Nabi, Stitt, Halford, and Finnerty (2006) found that voyeurism and three emotional reactions (happiness, surprise, and relief) positively predicted and one emotion (anger) negatively predicted enjoyment of reality TV shows (Chapter 16). Those who watched reality shows for relaxation and entertainment also perceived them as realistic (Papacharissi & Mendelson, 2007).

Rubin, Perse, and Powell (1985) found that informational viewing motives predicted parasocial interaction with newscasters. Kim and Rubin (1997) found exciting entertainment, information/ voyeurism, and social utility motives, along with attention, involvement and selective perception, predicted parasocial interaction with soap opera characters.

Satisfaction with soap operas has been predicted by exciting entertainment motivation, escapist relaxation motivation, and attention (Kim & Rubin, 1997; Perse & Rubin, 1988). Papacharissi and Rubin (2000) found that satisfaction with the Internet was predicted by information motivation and feeling valued by family and friends. Pornsakulvanich et al. (2008) found that using the Internet for self-fulfillment and affection motivation, and intended self-disclosure predicted interpersonal communication satisfaction.

Despite its emphasis on individual differences and people's media-use motives, U&G does not ignore the influence of the media. A major U&G assumption is that media are used functionally (e.g., to satisfy one's needs) and that the content consumed influences effects. For example, in a study of news media use by college students, Vincent and Basil (1997) found that current events knowledge was predicted by two specific news sources: print news and viewing CNN. Diddi and LaRose (2006) found that hometown newspaper reading was a better predictor of current events knowledge than the use of other mediated news sources, and that depth of coverage (across mediated sources) also related to current events knowledge. Baruh (2009) suggested that different types of reality show content (e.g., gossip, nudity, scenes in private settings) influence the voyeuristic appeal of such shows. What these types of U&G studies have in common that often differentiates them from other media-effects studies is that they see media content as just one factor amid other factors (such as media-use motives, activity, individual differences) that work in conjunction to influence effects.

Unintended Negative Media Effects

The above research suggests, on balance, that people's media use is relatively purposive and often results in need satisfaction and other intended positive effects. That does not mean, however, that there are not extraneous effects unrelated to media users' goals. As Katz et al. (1974) suggested, U&G recognizes that many if not most consequences of media use – positive or negative – may be unintended. For example, it is unlikely that people use media to become more aggressive, to experience fear, to cultivate limited perceptions of themselves or others, or to develop an unhealthy

reliance on a particular medium. But, U&G studies have uncovered such unintended or even detrimental perceptual, attitudinal, and behavioral effects.

For example, researchers have used a U&G framework to examine perceptual and attitudinal media effects. Some research has revealed that cultivation effects can at times be related to more passive – less selective and intentional – media use and at other times be related to instrumental use, depending on one's background characteristics, motives, attitudes about the media fare consumed (e.g., Rubin, Haridakis et al., 2003; Rubin, Perse, & Taylor, 1988), and enhanced by facilitative activity such as selective exposure and involvement (Kim & Rubin, 1997). Perse (1994) found that watching erotica for substitution (for a sexual partner) was related to acceptance of rape myths. Sexual enhancement and diversion motives related indirectly to rape myths through their links to hostile beliefs about women and exposure. In a study of problematic body attitudes among adolescents, Tiggemann (2005) found that a drive for thinness was related to soap opera viewing. Drive for muscularity among boys related to soap opera and music video viewing. Two TV viewing motives – social learning and escape from negative affect – were related to negative body image variables.

In studies of post-9/11 news use, some research has suggested that media news could be used for healthy ends, such as reducing uncertainty viewers felt in the aftermath of the tragic events of 9/11 (Boyle et al., 2004). However, other research has suggested that some TV viewers, such as those who measured higher in external locus of control and watched terrorist-related news stories for reasons of companionship, were more fearful (Haridakis & Rubin, 2005).

U&G research has also linked media use to negative behavioral effects. For example, Greene and Krcmar (2005) found that exposure to media violence was related to violent and risky behaviors. Haridakis (2002) found that disinhibited externally controlled males who watched televised violence primarily for entertainment were more aggressive than their counterparts. Haridakis (2006a) also found that the relationships among background characteristics, motives, and postviewing aggression differed by gender.

One behavior that has been receiving more attention recently is problematic media use that may reflect addiction to a medium. U&G researchers have long been interested in media dependency (see Sun, Rubin, & Haridakis, 2008). Through the prism of U&G, media dependency is considered a normal aspect of media use, because people are assumed to choose and rely on media they expect will satisfy their particular needs or desires. But, some research suggests that some media users may become overly dependent on a medium and exhibit more problematic and even addictive media-use behavior.

For example, Kim and Haridakis (2009) found that males were more prone to addictive Internet-use behavior. However, they found different manifestations of Internet addiction were differentially influenced by personality characteristics (locus of control, loneliness, shyness, and thrill seeking) and various motives (habitual entertainment, caring for others, escape, and excitement).

Social Media Use

In recent years, researchers have been devoting progressively more attention to the study of the use of media for social interaction. Such inquiry has a long tradition in uses and gratifications studies. For example, social interaction (e.g., something to do with friends and family) is one of the motives identified in television viewing studies and measured in the television motives scale (Rubin, 1983). Lull (1980) documented several social uses of television by families. Research has also indicated that sports fans often use sports viewing to form group cohesion and/or identification and social connection with other fans (for a review see Haridakis, 2010).

The emergence of social media like YouTube, social networking sites, and blogs has heightened the need to understand better the social uses and effects of media that permit receiving, sharing, and creating messages. As referenced earlier, U&G studies have uncovered both more traditional media-use motives (e.g., entertainment, information) and social-related reasons (e.g., social connection, covieing) for using the Internet's social networking functions (Haridakis & Hanson, 2009). Some research has focused on identifying motives specifically for the creation of online content (Leung, 2009).

The research has shown, not surprisingly, that socially interactive media such as cell phones and online communication are used to connect to friends, family, and business associates (Leung & Wei, 2000). They are used by diasporic individuals to achieve cross-cultural adaptation (Wang et al., 2009). They are also used to play games with others (Spinda & Haridakis, 2008).

Some studies have explored use of newer media to interact with strangers. Peter, Valkenburg, and Schouten (2006) found that younger adolescents were more likely to talk to strangers, as were adolescents who engaged in longer chat sessions. Adolescents who chatted to be entertained, to meet new people, and for social compensation tended to engage in more online communication with strangers. Those who were online more often interacted less frequently with strangers. Cho (2007) examined the influence of gender and motives on adolescents' self-disclosure in online chatting with strangers. Although gender did not predict self-disclosure, different motives (for interpersonal relationships, information, entertainment) did have differential impacts on the level of online self-disclosure.

Some research has focused on the use of the Internet to enhance or develop relationships. Pornsakulvanich et al. (2008) found that people who tended to use the Internet for self-fulfillment, felt their face-to-face communication was rewarding, and shared their feelings with others felt closer to their online partners than their counterparts (those lower on these characteristics). Those who used the Internet for affection and self-fulfillment reasons, and intended to disclose their feelings were more satisfied with their online communication than their counterparts.

These studies suggest that people are using social media for a wide range of activities, and, consistent with uses and gratifications assumptions, motives and individual differences differentially influence the various activities – viewing, sharing, and creat-

ing content – for which social media are used. The research also suggests that although people use social media for some of the same reasons they use more traditional media, there is a distinctly *social* aspect to social media use that reflects their social networking characteristics.

Conclusion

Like any theoretical approach, uses and gratifications has attracted criticism over the years. Critiques have ranged from methodological concerns such as researchers' reliance on self-reports to theoretical concerns regarding a lack of clarity of concepts, and for focusing too much attention on the individual and too little emphasis on the media's effects on cultural and societal factors (see Rubin, 2009).

Despite such alleged shortcomings, U&G has remained one of the most utilized media-effects theories. In fact, in a recent meta-analysis of research on just one medium – the Internet – Kim and Weaver (2002) found that nearly 22% of theory-driven articles from 1996–2000 mentioned or applied U&G. Arguably, U&G is a prominent theory in the twenty-first century because studies continue to support its fundamental tenets.

Perhaps one of the perspective's enduring strengths is its focus on the individual. This attribute has enabled it to be adapted to study uses and effects of each new medium that has emerged on the media landscape. Contemporary media environments in which people have more media choices and the ability to use media to not only receive content, but also create and share it, most likely makes the individual more important in the media use and effects process than ever before.

As Rogers (1986) said, media are tool technologies. The ways people have found and adapted these tools to satisfy their needs is one of the most important inquiries in media effects research. With its emphasis on individual differences, social contexts of media use, activity, and the importance of motives and needs, U&G has proved to be a valuable theory in that inquiry. Research guided by the perspective has indicated that understanding any media effect cannot be accomplished without considering how these various factors work in concert to produce the effect. Whereas some theories such as Cultivation focus on a particular medium, and others such as Agenda Setting and Framing focus largely on institutional media, U&G transcends media by focusing on the one enduring link in the process: the individual.

Media Entertainment as a Result of Recreation and Psychological Growth

Tilo Hartmann

ABSTRACT

Media entertainment refers to users' enjoyment of media-induced sensations. This chapter argues that users feel entertained to the extent that media supports their adaptive tendencies to recreate and grow psychologically. Within the boundaries of their physiological regulation, users are believed to engage actively in cognitive, affective, and behavioral challenges imposed by media, in order to grow psychologically. However, a lack of physiological resources may limit users' engagement in challenges and consequently strengthen their enjoyment of more recreational and supportive media content.

Theorizing Media Entertainment

Media entertainment has been characterized traditionally as an enjoyable experience for the user (Vorderer, Klimmt, & Ritterfeld, 2004; Zillmann, 2003). Such a perspective views entertainment as a hedonistic user experience, typically triggered by cheerful comedy shows, light-hearted romantic stories, stimulating action movies, or relaxing media offerings (Bosshart & Macconi, 1998). In contrast, alternate approaches suggest that users may also feel entertained by media offerings evoking less hedonistic, but more serious and perhaps even sad experiences (Oliver, 2009; Tan, 2008).

This notion corresponds to the observation that media users may actively seek media content that evokes sad feelings, such as “tearjerker” movies, or horror or action movie content which induces aversive states such as fear or suspense (Andrade & Cohen, 2007; Mundorf & Mundorf, 2003; Oliver & Bartsch, 2010). Users may also enjoy these typically aversive states in the safe context of media exposure.

As such, media entertainment does not necessarily comprise only light-hearted enjoyment. Rather, users may feel entertained provided that media content stimulates any state of enjoyment. For example, users may enjoy a distressing action movie as they reappraise positively aversive states triggered by the movie (Andrade & Cohen, 2002; Oliver & Bartsch, 2010). In such a case, both positive and negative affects (or enjoyment obtained from aversive states) underlie users’ feelings of being entertained. Typically, in order to feel entertained, users’ pleasure responses must outweigh negative sensations experienced during exposure.¹ A number of examples exist in which negative sensations prevail, however, and as a consequence users fail to feel entertained. For example, users may feel bored by media content (Bosshart & Macconi, 1998). Alternatively, users may fail to enjoy as a consequence of feeling cognitively and affectively overwhelmed, deeply threatened or annoyed by media content (Zillmann, 1988). Taken together, this suggests that “users feel entertained over a certain episode [...], if they enjoy the ongoing chain of their own primary affective responses” (Vorderer & Hartmann, 2009, p. 545), triggered by media content.

Media entertainment research suggests a number of different mechanisms as to why users feel entertained and enjoy their primary responses to media content (for reviews see Bosshart & Macconi, 1998; Bryant & Miron, 2002; Klimmt & Vorderer, 2009; Oliver, 2009; Vorderer, 2003; Vorderer & Hartmann, 2009; Zillmann & Bryant, 1986). The aim of this chapter is not to review each of these mechanisms separately, but to discuss media entertainment from an integrated theoretical perspective derived from pleasure research. Research on pleasure in sexual intercourse (Boul, Hallam-Jones, & Wylie, 2009), food intake (Rozin, 1999), economical behavior (Kahneman, Wakker, & Sarin, 1997), decision-making (Hsee & Hastie, 2006), art appreciation (Silvia, 2005), music (Huron, 2005), literature (Nell, 1988), and audiovisual media exposure (Miron, 2006), suggests that pleasure responses are evoked typically by biological and psychological mechanisms that are responsible for promoting adaptive functioning throughout evolution (e.g., Cabanac, Pouliot, & Everett, 1997; Miron, 2006; Rozin, 1999; White, 1959). According to Damasio (1999, p. 78), “pleasure seduce[d] us into good behavior.” Likewise, Kahneman et al. (1997, p. 379) argue that “pleasure is evidently a ‘go’ signal, which guides the organism to continue important activities such as foreplay or consuming sweet, energy-rich food.” An abundance of studies have similarly documented the health-promoting effects of pleasure (Esch & Stefano, 2004; Zillmann, 2000). Pleasure responses thus appear tied to basic – and often adaptive – human tendencies. In line with this, I suggest that people enjoy media content based upon pleasure responses which are tied to two adaptive tendencies; to recreate and to grow psychologically through engagement in challenges.

The Enjoyment of Recreation and Psychological Growth

Throughout evolution, the human organism has struggled to sexually reproduce and to survive in potentially risky and unstable environments. Several mechanisms (or adaptations) that have evolved throughout this struggle for survival have become tied biologically to the reward or pleasure system of the human organism (Tooby & Cosmides, 1990). Via genetic reproduction, these mechanisms have become an integral part of being human. In accordance with these basic human mechanisms, contemporary environments, including media environments, are able to trigger pleasure responses (Miron, 2006; Ohler & Nieding, 2006). I argue that two of these basic mechanisms are crucially important in the media entertainment context; recreation (via homeostatic regulation and the replenishment of exhausted resources) and psychological growth (via engagement in challenges).

Recreation is adaptive, allowing “individual functional systems that have been called upon during a stressful experience to return to their prestressor levels” (Sonnentag & Fritz, 2007, p. 205). Homeostatic regulation, that is, the ability to keep physiological resources in balance, may be considered part of an individual’s tendency to recreate. Homeostatic regulation maintains important parameters such as body temperature, arousal, and metabolic states within the optimal life-functioning range (Damasio, 1999). Pleasure provides the motivation to regulate and return imbalanced states to normal levels (“alliesthesia,” Cabanac, 1985; Saper, Chou, & Elmquist, 2002). For example, food intake is more pleasurable when people are hungry compared with satiated. Likewise, arousing media content is more pleasurable when people are bored rather than stressed (Zillmann, 1988).

In general, homeostatic regulation is eased by life-promoting environments. Humans possess a natural tendency to seek and enjoy supportive environments, particularly when they require recreation (Sonnentag & Fritz, 2007). Due to the genuine importance of this mechanism, pleasure responses appear to be triggered simply by the awareness of supportive surroundings. For example, the mere perception of beautiful, or sweet and energy-rich objects seems to trigger pleasure (Kahneman et al., 1997). As such, humans may enjoy furnishing their living environment with flowers (Haviland-Jones, Rosario, Wilson, & McGuire, 2005) or being immersed in nature, such as a lush meadow or forest, particularly when feeling exhausted (Kaplan, 1995). Likewise, users appear to enjoy perceiving supportive environments portrayed by the media, particularly if they undergo depleting life episodes (Katz & Foulkes, 1962).

However, the principle of pleasurable recreation is not sufficient to explain all types of media entertainment, such as enjoyment of shocking horror movies or distressing videogames. As White (1959, p. 315) states, “we may seek rest and minimal stimulation at the end of the day, but that is not what we seek in the morning. Even

when its primary needs are satisfied and its homeostatic chores are done, an organism is alive, active, and up to something.” According to White, humans have an innate motivation to improve their “capacity to interact effectively with [their] environment” (p. 297) and, as such, engage readily in various environmental challenges. Engaging in challenges is adaptive, as it may result in learning and skill development, that is, progress towards more efficient interaction with the environment. Successfully engaging in challenges is rewarded with pleasure. This notion has been addressed in Positive Psychology under the label “psychological growth.” It receives specific support from research into self-determined activity and intrinsic enjoyment (Ryan & Deci, 2002). In general, users may enjoy media exposure not only because the situation allows them to recreate, but also because it provides important learning experiences, which improve capabilities and allows psychological growth (e.g., Oliver, 2009; Tamborini, Bowman, Eden, Grizzard, & Organ, 2010; Vorderer, Steen, & Chan, 2006). Accordingly, enjoyment of both recreation and psychological growth may provide two crucial aspects of media entertainment. These aspects will be elaborated further in the remainder of this chapter.

Enjoyable Recreation During Media Exposure

Media entertainment is typically pursued during leisure time, perhaps after a strenuous day at work (Sonnentag & Fritz, 2007). Leisure time situations are typically self-determined and free of external pressures. People may use such leisure time for recreational activities, that is, to recover from the preceding demanding episode (Sonnentag & Fritz, 2007). As understood in this chapter, recreation refers to both the harmonizing of imbalanced physiological states (homeostatic regulation) and the replenishment of exhausted physiological resources, with both processes linked to pleasurable responses. Media exposure provides a comparatively effortless way to recreate.

Homeostatic Regulation

Homeostatic regulation relates to maintaining physiological states, such as body temperature or arousal, within the optimal life-functioning range (Damasio, 1999). Rather than being fixed, these optimal levels vary according to a person’s condition (e.g., in order to fight an infection, a comparatively high body temperature may be rewarded, Cabanac, 1971), and higher-order cognitive goals (e.g., a higher body temperature may be desired in a sauna). Successful regulation towards optimal levels results in pleasure. Alliesthesia research (Brondel & Cabanac, 2007; Cabanac, 1971, 1985;), for example, demonstrates that sensory stimuli may arouse pleasant or unpleasant sensations dependent upon current internal states and goals. Likewise,

reversal theory (Apter, 1989, 1992) indicates that arousal is perceived as either pleasurable or aversive based upon the optimal level sought by an individual. For example, high levels of arousal will be experienced as pleasurable when an individual seeks excitement, yet experienced as unpleasant when an individual seeks relaxation. Equally, low levels of arousal will be experienced as pleasurable when seeking relaxation, yet unpleasant when seeking excitement.

A similar argument has been put forward by mood management theory (Helwegel & Weaver, 1989; Zillmann, 1988; Zillmann & Bryant, 1985). Mood management theory provides one of the most popular media entertainment theories addressing pleasure responses to media content and proposes that individuals use the media in order to terminate noxious states and intensify hedonic states. More specifically, the theory argues that people seek and enjoy the reduction of negative mood states and the enhancement of positive mood states (valence hypothesis). Sharing similarities with reversal theory, mood management theory further claims that users enjoy media provided media support their homeostatic regulation. People may thus seek and enjoy exciting media content in states of *extreme* boredom, yet seek soothing media content in states of *extreme* stress (arousal hypothesis). Existing research appears to support this assumption (e.g., Bryant & Zillmann, 1984; Knobloch-Westerwick, 2006; Oliver & Bartsch, 2010).

Findings related to the arousal hypothesis of mood management theory support the notion that people enjoy media content, which provides recovery from imbalanced physiological states. However, in contrast to reversal theory, mood management theory deals only with enjoyment among users attempting to recover from *extreme* states of overarousal or underarousal. In this context, reversal theory may complement the existing theoretical corpus by studying more broadly users' enjoyment of media content, which helps shifting arousal states towards optimal levels. Taken together, media exposure appears to be entertaining provided it supports users' recreational needs and enables them to regulate imbalanced physiological states.

Recovery of Physiological Resources

Recreation also refers to the recovery of depleted cognitive and physiological resources. Research on ego-depletion (Baumeister, Bratslavsky, Muraven, & Tice, 1998) suggests that, for example, demanding cognitive activities, such as decision-making or abstract thinking, require volitional energy. Volitional energy is a cognitive resource that is based partly on blood glucose expended by these activities. If depleted, an organism's "readiness to re/act" becomes limited. Ego-depleted individuals thus become more passive and less regulated. They exhibit a stronger tendency for confirmatory information processing (Fischer, Greitemeyer, & Frey, 2008), are more susceptible to impulsive choices (Baumeister, 2009), suffer worse performance in logical reasoning (Schmeichel, Baumeister, & Vohs, 2003) and other demanding tasks, and abandon these tasks sooner than non-depleted individuals. Volitional

energy, however, may be replenished via sleep, sugar intake, and also via pleasurable media stimuli (Tice, Baumeister, Shmueli, & Muraven, 2007). When depleted, people may avoid activities demanding self-regulation and, instead, may engage in accessible and scarcely challenging activities, such as media use. Exposure to entertaining media may be particularly attractive, as it promises to replenish exhausted resources.

While direct empirical evidence is scarce, weary, and ego-depleted individuals may indeed seek media entertainment as a recreational experience (Reinecke, 2009a, 2009b). Anderson, Collins, Schmitt, and Jacobvitz (1996) note, for example, that stressful life events predict length of exposure to televised entertainment, particularly comedy shows. This may be plausibly interpreted in light of mood management theory, as stressful life events are likely to be associated with strain and exhausted resources. In the Anderson et al. (1996) study, stressed men tended to watch more violent action, and horror programming, while stressed women tended to watch more game shows. A panel study by Brosius, Rossmann, and Elnain (1999) likewise indicated that individuals who felt more depleted following an increased workload in their jobs spent more time watching entertaining television content. These findings may suggest that depleted individuals find media exposure pleasurable as it helps replenish exhausted resources.

Recreation requires the “dismantling” of existing real-world stressors. This typically implies that people become distracted and psychologically detached from such stressors (Sonnentag & Fritz, 2007). Entertainment research frequently suggests that users enjoy the distraction of comforting media realities in order to escape troublesome life conditions (Katz & Foulkes, 1962; Moskalenko & Heine, 2003). Escapism refers to the idea that people occasionally lack the coping capabilities for everyday-life problems. Under such conditions, people may enjoy media distraction. In an experimental study by Moskalenko and Heine (2003), after receiving negative feedback, participants sought distraction from television for a longer time than participants receiving positive feedback. Media content may be particularly distracting when it is highly absorbing (Zillmann, 1988), perhaps because a gripping storyline provides ample opportunity for wishful fantasizing (Katz & Foulkes, 1962). In sum, these findings suggest that people may find pleasurable relief in the distraction provided by media offerings.

Recreating in Supportive Environments

In general, people may find it pleasurable to become immersed in life-promoting, that is, supportive and peaceful environments, particularly when seeking recreation (Kaplan, 1995). Likewise, individuals seeking recreation may find particular enjoyment in using media as a self-determined activity in a sheltering environment (i.e., warm and safe), such as their own private living room. Environments may be also supportive, because they foster social inclusion (Ryan & Deci, 2002). Indeed, people frequently enjoy media in social settings with friends (Bryant & Miron, 2002;

Sapolsky & Zillmann, 1978). In addition, media may provide vivid illusions of social connectedness. For example, people may feel included socially via engaging in parasocial interactions with media characters (Horton & Wohl, 1956). Experimental studies show that users enjoy media content more if they feel that they are being addressed directly by a media character (Auter & Davis, 1991; Hartmann & Goldhoorn, 2011). While these studies suggest that social connectedness is an important aspect of media entertainment, it remains plausible, albeit untested, that especially weary or depleted individuals seek and enjoy social companionship via their media exposure.

Individuals appear to prefer and enjoy different media content when weary or depleted compared to when they are well-rested (Brondel & Cabanac, 2007). For instance, depleted individuals will avoid cognitively taxing media content when seeking to recreate from previous demanding cognitive tasks (Sonnentag & Fritz, 2007). Indeed, depleted individuals may fail to enjoy any media content requiring further self-regulation. Accordingly, depleted individuals are unlikely to engage in challenging media content, particularly when the challenges imposed require self-regulatory efforts which will drain already impoverished resources. Individuals will seek engagement in mediated challenges matching their capabilities for the sake of enjoyment, only to the extent that the necessary physiological resources are available.

Enjoyable Psychological Growth During Media Exposure

Humans are not purely recreating organisms, regulating physiological states and recovering exhausted resources. Rather, they have a natural tendency to engage in risky environments for the sake of “psychological growth and integration” (Ryan & Deci, 2002, p. 3). This view is commonly expressed in Positive Psychology: “Rather than viewing people as passively waiting for a [physiological] disequilibrium, we view them as naturally inclined to act on their inner and outer environments, engage in activities that interest them, and move toward personal and interpersonal coherence” (Deci & Ryan, 2000, p. 230). In accordance with this view, humans, driven by curiosity and interest, have a tendency to explore their environment in order to improve capabilities, and gain a better understanding of their own existence. This may be viewed as a tendency to seek psychological growth.

Following White (1959), humans achieve psychological growth by engaging continuously in challenging interactions with the environment. Deci and Ryan (2000, p. 229) suggest that “it is part of the adaptive design of the human organism to engage interesting activities, to exercise capacities, to pursue connectedness in social groups, and to integrate intrapsychic and interpersonal experiences into a relative unity.”

Generally speaking, psychological growth is achieved via the mastery of challenges. As long as these challenges are sought autonomously, their mastery is enjoyable and accompanied primarily by the perception of competence (and, frequently, social connectedness; Deci & Ryan, 2000). For example, people may enjoy mastering previously incomplete challenges in a videogame, particularly if achieved with a friend (Tamborini et al., 2010).

However, engaging in challenges is cognitively and physiologically taxing, and the outcome is often uncertain. Individuals may thus expend valuable resources discovering that their capabilities are insufficient to master a challenge. Two explanations exist as to why humans are inclined nevertheless to engage in challenges. Firstly, such engagement is driven by pleasurable emotions such as interest and curiosity (Silvia, 2005; Tan, 2008; White, 1959), which may counterbalance simultaneous negative experiences (Cabanac, 1992). Secondly, people are frequently willing to forego pleasure for the sake of long-term goals (Blascovich, 2008; Tamir, 2009). Engaging in challenges serves the ultimate long-term goal of psychological growth and mastery is rewarded with (intrinsic) pleasure (Deci & Ryan, 2000). They are thus likely to be sought even when they are effortful.

The term “challenge,” as used here, refers to a variety of cognitive, affective, visceral, and behavioral tasks imposed by the media environment. Challenges are taxing, require the investment of resources, and their outcome is comparatively uncertain. Mastery of challenges reveals the existence of important capabilities among individuals. Apter (1992) distinguishes between four types of challenges; (1) exploration of novel information, (2) voluntary confrontation with frustration, (3) overcoming basic physical limitations, and (4) active violation of social rules and other expectancies. Likewise, media content may challenge people in many ways. For example, entertainment media provide an abundance of novel information, ranging from social information from soap operas, novelty from fantasy worlds, and factual information via documentaries and quiz shows. Media also frequently challenge users by confronting them with innate body reactions such as fear. Media may further challenge users by violating social norms, displaying harsh forms of violence, sexual conduct, and other such unacceptable behavior. To reduce complexity, the array of challenges provided by entertainment media may be grouped roughly into cognitive, affective or visceral, and behavioral challenges. Some typical examples are discussed below.

Cognitive Challenges

Typically, enjoyment is induced when individuals engage in cognitive challenges and recognize that they are able to comprehend effectively (Biedermann & Vessel, 2006). Cabanac et al. (1997) suggest that pleasure results from effective cognitive mental work. In one of their studies, students displayed greater enjoyment of a poem, the more they were able to comprehend it. Likewise, Silvia (2005) noted that people found cognitively challenging abstract art more enjoyable when titles were provided allowing a meaningful

interpretation, rather than if no titles were provided. Comprehension of very familiar stimuli that are not cognitively challenging at all may also not be enjoyable as it fails to reveal psychological growth (Biedermann & Vessel, 2006). Much entertainment media provide comparatively familiar content and may be considered moderately cognitively challenging. Reasonably familiar stimuli are perceived as more pleasurable than entirely novel or overly familiar stimuli (Zajonc, 1968). Media content may thus be entertaining simply because it displays moderately novel content, less familiar than the real world, yet more familiar than abstract art, for example. Media content that is extremely easy (e.g., children's movies) or extremely difficult to comprehend (e.g., complex arthouse movies) may not be typically enjoyable. Accordingly, comprehension of media content may be enjoyable provided it involves the mastery of moderately difficult cognitive challenges.

In line with the idea that comprehension of moderately novel media is enjoyable, individuals may also appreciate media content that is cognitively challenging, because it puts their life into perspective. Most people become anxious about chaotic life circumstances, yet enjoy information that helps them make sense of life. Research into the principles of a good life and maturity (King, 2001), and ego-development (Bauer & McAdams, 2004), suggests that people enjoy gaining a more complex and integrated view of themselves, their life, and their world. Such insights move beyond mere positive self-related information and instead refer to more transcendental life aspects. Growing research of relevance to media entertainment indicates that users appreciate thought-provoking movies which provide meaningful insights (Oliver, 2008, 2009; Oliver & Bartsch, 2010, 2011). Such meaningful experiences typically entail mixed emotions (i.e., pleasurable yet also painful facets, Oliver, 2008). Users may also experience meaningful and thought-provoking moments in movies that are funny or suspenseful predominantly (Oliver & Bartsch, 2010; Oliver & Hartmann, 2010).

Affective Challenges

Users may also enjoy mastering aversive innate body reactions triggered by the media. Akin to hedonic reversals and pleasurable "mind-over-body realizations" in the context of painful food-intake (Rozin, 2000, p. 980), media users may take pleasure in many innate or highly automatic body sensations, which are actually painful or distressing (e.g., Andrade & Cohen, 2007; deWied, Zillmann, & Ordman, 1994). Horror movies provide one such example. Ample research demonstrates that males particularly enjoy the fear and distress induced by horror movies, especially if they are able to demonstrate their skills of mastery before a distressed female coviewer (Hoffner & Levine, 2005; Zillmann & Weaver, 1996; Zillmann, Weaver, Mundorf, & Aust, 1986). Reversal theory (Apter, 1989) provides a useful framework for studying such hedonic reversals. According to this theory, dangerous stimuli may be experienced as exciting, provided individuals perceive themselves as surrounded by a "protective frame" (e.g., observing a spider through a thick

glass). Such a protective frame may be purely imaginative. For example, males may enjoy horror movies more than females as they feel more protected and more capable of withstanding induced fear. Research by Andrade and Cohen (2007) suggests that such a “protective frame-of-mind” indeed moderates the impact of fear-inducing horror movies on enjoyment.

Behavioral Challenges

Mastery of behavioral or interactive challenges is pivotal to videogame play. Almost all videogames challenge the user’s hand-eye coordination. Videogames offer challenges with difficulty levels which adapt to the skills of the user and further provide clear feedback to inform users of their progress. Users may feel successful (Klimmt, Hartmann, & Frey, 2007) and competent when mastering the challenges imposed by videogames. Due to these structural aspects, videogames are capable of inducing pleasurable experiences of flow (Sherry, 2004).

It may be argued that non-interactive media allow users to vicariously experience the mastery of behavioral challenges. Dramatic narratives within action movies, for example, typically focus on the struggle between a protagonist (the good guy) and an antagonist (the bad guy), usually concluding with a happy ending in which the good guy triumphs over the bad guy. This happy ending may be enjoyable as the victorious protagonist communicates to the user that his (ideological) in-group is more powerful than the alternative. From such a perspective, users may bask in the glory of the protagonist and feel as though their own capabilities have been improved (Zillmann, Bryant, & Sapolsky, 1989).

Ample evidence in the context of disposition theory (Zillmann & Cantor, 1976; for an overview see Raney, 2003), one of the most important and established theories in the domain of media entertainment, indicates that viewers of dramatic content indeed demonstrate enjoyment when good triumphs over bad. Drama typically builds upon a struggle for justice. Viewers find enjoyment in the uplifting realization that the world is a just place and that the group whose values they share triumphs over the group whose values they do not share. Physiological processes play an important role in this process. Excitation transfer theory (e.g., Zillmann, 2006) suggests that the time-compressed chain of events in a stressful drama builds high arousal states in users. These high states of arousal turn into euphoria upon realization that the good guys triumphed over the bad guys.

General Characteristics of Enjoyable Challenges

Taken together, media offer an abundance of easily accessible challenges. In general, these challenges promise the most enjoyment when they are relevant to the user, when the user can autonomously engage in the challenge, and when the challenge

is of optimal difficulty (Blascovich, 2008; Rozin, 1999; Ryan & Deci, 2002; Sherry, 2004; White, 1959).

Challenges are perceived as relevant provided they inform an individual about a relevant aspect of himself or herself. Users are unlikely to enjoy the mastery of a challenge that indicates the existence of capabilities which are irrelevant. Consequently, the enjoyment of a given challenge varies in accordance with both gender and age. Male users, for example, appear to find greater enjoyment in challenges related to power, such as sports or violent videogames (Jansz, 2005). In contrast, female users appear to be more interested in challenging capabilities related to their social environment (for a general review of gender differences in media entertainment see Oliver, 2000).

In addition, research on intrinsic enjoyment and motivation indicates that people do not enjoy challenges when they feel compelled to master them. Rather, they enjoy engaging in challenges autonomously (Ryan & Deci, 2002). Use of entertainment media may frequently be accompanied by a sense of autonomy as it typically takes place at home during leisure time. During such leisure time, individuals are comparatively free to choose whatever media content they wish. They may determine freely the challenges in which they become involved. Accordingly, they may enjoy such media imposed challenges. Bidjerano and Newman (2010), for example, noted that autonomy in media activity choice was positively related to reported enjoyment and inversely related to anxiety associated with these activities.

Furthermore, research regarding both achievement and intrinsic motivation suggests that challenges are most enjoyable when they are of optimal difficulty (Harter, 1978). This implies that the challenge must be so new or complex that it can only be potentially mastered if individuals spend considerable effort and fully utilize their existing capabilities. Mastering challenges of optimal difficulty provides not only positive feedback but also new insights regarding the self. In contrast, challenges that are too easy are uninformative, as their mastery is obvious. In turn, challenges which are too difficult cannot be mastered and thus provide only negative feedback about existing skills and capabilities. Taken together, this suggests that media content may offer a diverse array of challenges. Media users may enjoy engaging autonomously with relevant challenges of optimal difficulty.

Physiological Boundaries of Challenge-Seeking

Users may engage willingly in challenges promoting their psychological growth. However, challenge-seeking necessarily occurs within the limitations of recreational demands. It thus seems plausible that users approach challenges that match their present physiological states and may withdraw from potentially threatening challenges (Blascovich, 2008). It is unlikely, for example, that individuals would enjoy engaging in challenges that threaten seriously their homeostatic balance (Rozin, 1999). Instead, they tend to approach and enjoy challenges that match their physiological

needs (Brondel & Cabanac, 2007). By definition, challenges bear a certain risk (Apter, 1992). Accordingly, attempts to master a challenge require self-regulation and sufficient volitional energy. Exhausted or depleted users may thus fail to enjoy challenges in which engagement and mastery demand self-regulation and volitional energy (Schmeichel, Demaree, Robinson, & Pu, 2006). Exhausted users may be prone to engage in comparatively less demanding challenges.

If cognitive resources are already exhausted, for example, stressed users are unlikely to seek the challenge of comprehending a complex philosophical book (Schmeichel et al., 2003), even if reading promises to reduce arousal and enhance psychological growth. Rather, such users may enjoy watching a mildly cognitively challenging movie. Likewise, depleted individuals who seek excitement may be interested in arousal-stimulating challenges presented via familiar and predictable content. They may enjoy, for example, recovering exhausted resources by sitting on the sofa and watching a familiar, yet arousing, thriller movie.

Conclusion

Based on a review of existing media entertainment research, this chapter argues that users feel entertained provided media induce enjoyable states and sensations. The core argument is that users enjoy media exposure to the extent that it assists their tendencies to recreate and grow psychologically. More specifically, media exposure is enjoyable – and thus entertaining – if it allows users to balance their physiological states and recover exhausted resources. Additionally, each media stimulus imposes a set of cognitive, affective, and occasional behavioral challenges. Users may enjoy engaging autonomously in mediated challenges which are relevant, of optimal difficulty and mastery or which indicate psychological growth. However, users may enjoy engaging in challenges only within the boundaries of their recreational needs.

Taken together, the present approach argues that media entertainment results from successful recreation and psychological growth. Similar approaches to media entertainment have been suggested in the past. Evolutionary approaches to media entertainment (Miron, 2006; Ohler & Nieding, 2006) share the idea with the present approach that enjoyment results from the stimulation of evolutionarily evolved and thus formerly adaptive pleasure systems. Another similar approach has recently been suggested by Tamborini et al. (2010). In their approach, they argue that media enjoyment results from the satisfaction of lower-order (e.g., physiological) needs and higher-order (e.g., intrinsic/self-actualization) needs. In their study, they provide preliminary empirical evidence that the satisfaction of intrinsic needs indeed underlies media enjoyment. Tamborini et al.'s (2010) satisfaction of lower-order needs is reminiscent of the recreational mechanisms reviewed in the present chapter, whereas the satisfaction of (intrinsic) higher-order needs is reminiscent of enjoyment derived from psychological growth.

A Concluding Remark on the Adaptive Function of Media Entertainment

The present perspective links media entertainment to evolutionary adaptive mechanisms. Namely, enjoyment derived from recreation and psychological growth. This corresponds to the general notion that pleasure is tied to adaptive mechanisms (Cabanac et al., 1997; Damasio, 1999; Dutton, 2009; Kahneman et al., 1997; Miron, 2006; Rozin, 1999; White, 1959). It is tempting to speculate that media entertainment still provides adaptive functions today. For example, it is clear that people need to occasionally relax and recover. It thus seems adaptive that exhausted resources are recovered and imbalanced physiological states become balanced. Entertaining media stimuli are easily accessible tools that may help effectively accomplish these needs (Reinecke, 2009a, 2009b; Repetti, 1989). In addition, media exposure may result in psychological growth and thus improve individuals' capabilities to interact effectively with their environment.

However, while this may suggest that individuals adapt to their environment when entertained by the media, the underlying mechanisms of this adaption evolved throughout phylogenesis in a remarkably different environment thousands of years ago. Accordingly, they may not necessarily foster adaptive behavior today. For example, in some parts of the world, the once adaptive mechanism of finding sweet and energy-rich food pleasurable may now lead to obesity. Likewise, it does not appear adaptive if obese people – reinforced by enjoyment – prefer media challenges to comparable, yet physically more demanding challenges, in the real world. Further, individuals may fail to adapt to their living environment if they continuously seek escape via the media rather than coping actively with existing problems in the real world (Katz & Foulkes, 1962). It remains to be seen whether such non-adaptive media entertainment outcomes are the exception or the rule.

NOTE

- 1 Differing mechanisms may explain this principle. Pleasure may outweigh aversive sensations throughout an exposure period, as users reappraise directly aversive sensations as something positive (Andrade & Cohen, 2007). In contrast, aversive sensations may dominate throughout the exposure period (without much positive reappraisal), yet intense states of pleasure, typically at the end of exposure, allow the overall experience to be framed as enjoyable (Zillmann, 2006).

Selective Exposure to Violent Media

A Synthesis of the Research and Theoretical Overview

Marina Krcmar

ABSTRACT

This chapter reviews the research that has examined individuals' interest in media violence. It reviews definitions of media violence, as well as affect-based approaches to attraction to media violence (i.e., mood management and mood adjustment) and reviews the research findings that use this approach. Next, it reviews disposition-based theories that focus on how individuals evaluate media characters, form affiliations with them, and affectively respond to them. Disposition-based theories offer one possible explanation for attraction to media violence. Functional approaches (e.g., threat mastery) and psychological correlates of interest in media violence are also explored. Lastly, it proposes that social cognitive theory, when viewed as a meta-theory or meta-approach to interest in media violence, may offer an over-arching model to integrate the various perspectives reviewed in the chapter.

The Appeal of Media Violence

Concern about the *effects* of violent media date back at least as far as the 1920s when the Payne Fund studies investigated the effect of film violence on children (Lowrey & DeFleur, 1995) (Chapter 10, this volume). However, implicit in this concern is the

interest in media violence that must surely predate any effects. Obviously, we are not forced to consume media violence; yet, violent television, music videos, films, and videogames continue to be a booming business. So why do we consume it? This chapter considers the various theories and the empirical evidence that address this question. In addition, it attempts to integrate this literature into a comprehensive theoretical framework. After all, concern about the effects of media violence could all but disappear if only audiences would stop consuming it. With popular movies, television, videogames, and other media frequently and consistently depicting aggression and violence, that occurrence seems unlikely.

Selective Exposure

In general, studying interest in and attraction to media has fallen under the designation of selective exposure. As defined by Zillmann and Bryant (1985), “selective exposure designates behavior that is deliberately performed to attain and sustain perceptual control of particular stimulus” (p. 537). In short, research into selective exposure has assumed that we voluntarily choose the stimuli that we consume, including media. Furthermore, this approach recognizes that our choices are likely to be guided by affective, psychological, functional, and even incidental factors, and seeks to uncover what those factors are and the interrelations between them and our ultimate media choices. There have been many approaches to considering how and why we choose the media we do (e.g., Hartmann, 2009) and many ways of grouping the resulting theories and research. However, it seems appropriate to consider our choices as deriving from several broad motivations: We choose media (and other stimuli for that matter) (1) for affective and excitatory reasons such as fleeting moods (e.g., mood management, mood adjustment; Chapter 7, this volume); (2) for functional reasons such as fulfilling a need for information (e.g., uses and gratifications; Chapter 6, this volume); (3) due to internal personality and dispositional factors that drive our likes and interests; (4) for sociological reasons including cultural norms that may arise from our gender or our peer group or the desires of other members in our audience group; (5) or for incidental reasons: Perhaps I do not like the violence in a particular film, but I am watching it because it is showing in the waiting room while my car is being serviced.

If we begin to consider theories that explain the process of selective exposure that can be applied to interest in violent media and we consider the empirical work that has been done on the topic, the work tends to fall into at least one, if not more of these broad categories. However, prior to exploring our motives for violent media consumption, it is important to consider what we mean when we call something “violent media”. Thus, the following sections begin by discussing the *meaning* of violent media. Second, several theories are considered that emphasize the role of *arousal and affect* in media use, including mood management, mood adjustment and disposition theories and these are considered in terms of interest in violent media.

Third, the focus is on the areas of theory and research that emphasize the importance of *personality* in determining violent media choice. These include some uses and gratifications approaches as well as simple variable analytic research that has examined personality variables and media choice. Fourth, the sociological factors and incidental factors are considered that may influence interest in and attraction to media violence.

What is Media Violence?

In order to ask why we consume media violence, it is important to consider, however briefly, what we mean by media violence. For example, a televised match of football in the United States or a contact sport videogame may be violence to one viewer and good, clean family entertainment to another. Marvin (2000) has argued that researchers have never fully agreed on what constitutes media violence and that, in fact, this disagreement is instructive. She states: "Morality intrudes at every point of framing what counts as an act of violence" (p. 156). In other words, our definitions of violence are guided in part by individual, and thus sometimes idiosyncratic, moral judgments. Nevertheless, it seems both important, and, in my opinion, possible, to make some broad claims about media violence: What it is, how it influences us and, why we consume it in the first place.

Some researchers have defined violence in terms of any act of aggression, including comedic acts and those that result from non-human sources, such as acts of nature (Gerbner, Gross, Jackson-Beeck, Jeffries-Fox, & Signorielli, 1978). The Cultural Indicators project, conducted by George Gerbner and colleagues at the University of Pennsylvania defined violence broadly as: "the overt expression of physical force, with or without weapon, against self or other, compelling action against one's will on pain of being hurt or killed, or actually hurting or killing" (Gerbner et al., 1978, p. 179). The National Television Violence Study, on the other hand, defined it somewhat more narrowly: "Intentional acts of force attempting to physically harm an animate being" (Smith, Moyer, & Donnerstein, 2006). Not surprisingly, the researcher's definition of violence affects the amount of violence detected in a content analysis and is likely to influence effect sizes in effects studies and in research on selective exposure to media violence. Despite variations in researchers' definitions of violence, Riddle and colleagues point out that audiences differ in their judgments of violence to an even greater extent (Riddle, Eyal, Mahood, & Potter, 2005). Whereas researchers tend to count individual acts of violence, audiences rely on the explicitness and graphicness of violence in order to determine if and how violent something is. Thus, perhaps scholars of media violence should focus greater attention on the degree of explicitness and graphicness in media violence, and stimuli chosen for effects studies, in order to determine why we watch violence and what the outcomes of viewing are. On the other hand, even sanitized violence, or *especially* sanitized violence, has been found to have negative effects

on viewers (e.g., Bushman & Huesmann, 2001) making it necessary for scholars to consider the degree of graphicness as a factor in defining violence but not a necessary factor in determining if something is violent. In any case, a reading of the extant literature suggests that not only are the best definitions of violence somewhat narrow and precise, but they focus on violence that is intentional, conducted by an animate being (e.g., human beings, cartoon monsters and animals, videogame characters) on an animate being and the definitions should consider explicitness and graphicness as *variables* in influencing selective exposure and effects.

From sports violence to unabashedly graphic portrayals, why do we watch? In her essay, Goldberg (1998) observes that most Westerners' first-hand experience with death and violence have receded dramatically since the eighteenth century at the same time that *representations*, both real (e.g., news) and fictional, have increased. She muses that perhaps we need to understand death and violence and that in consuming it in the safety of our living rooms, that experience is both instructive and safe. In other words, we watch mediated violence because we want to understand all aspects of life, including suffering and death and we no longer have real access to it (see also Oliver, 2003). Alternately, in considering the empirical literature on media violence, Sparks and Sparks (2000) offer three reasons for the appeal of violence: "because the violent images themselves evoke pleasure [...] or due to the enjoyment of things that co-occur with violence [...] or because of various gratifications that are indirectly related to the viewing of the images and are actually experienced after the images themselves are viewed (p. 74)." Thus, the reasons proposed by Sparks and Sparks (2000) parallel, to some extent, those that will be explored in the following sections. In sum, we consume media violence because we enjoy the affect or arousal of cognitions that we experience as the result of viewing, or we watch because we like the content that goes along with the violence, regardless of how we feel about the violence itself.

Excitation and Affect-Based Approaches

One possible reason for the selection of various media, both type (e.g., television vs. newspapers) and content (e.g., professional wrestling vs. drama) may be related to our emotions and our physiological arousal levels at the time of media selection. To say that I am "in the mood for an action/adventure film" is to imply that something about my emotional state is guiding me towards that. In fact, a sizeable body of research supports the link between our physiological arousal, our emotions, and our media choices at a given moment (see Knobloch-Westerwick, 2006 for a review). Furthermore, several theories have emphasized the importance of arousal and affect in guiding our media choices. Specifically, the theories of mood management and mood adjustment present arousal and affect as central in the selective exposure process; whereas, disposition theories rely more exclusively on affective responses and our attitudes towards characters.

Mood Management

Early theorizing about mood management actually fell under the title of Affect Dependency of Stimulus Arrangement (Zillmann & Bryant, 1985). In its earliest iteration, this theory posited that individuals strive to minimize negative mood states and maximize or maintain positive mood states by arranging their environment (including media) to achieve that goal. In this case, mood was conceptualized as having affective and arousal-based components. More recently, Zillmann (2000) summarized mood management by stating that selective exposure to media stimuli was based on choosing content that was “(a) excitationally opposite the prevailing states associated with noxiously experienced hypo- or hyperarousal, (b) has positive hedonic value above that of prevailing states, and (c) in hedonically negative states, has little or no semantic affinity with the prevailing states” (p. 104). In other words, individuals select media that produce arousal that is opposite to how one feels *when one does not want to feel that way*, leaving you better off than you were before. In addition, when you feel bad, you do not want to consume content that reminds you of whatever made you feel bad in the first place. These basic principles guide media choice.

The notion that we'll watch negatively-valenced content (e.g., violence) when it is *not* similar to our current sorrow-inducing experience, has been added to and refined in the theory over the past 30 years (notably Oliver, 2003). Thus, according to more recent theorizing in mood management, it seems unlikely that audiences are always attracted to media offering positive hedonic valence, rather, negatively valenced media may offer appeal only if the story line does not mesh too closely with negative experiences encountered recently in one's own life. Thus, violent media, even with tragic story lines, may be attractive in some cases. Perhaps violent professional wrestling may be appealing to a recently-returned veteran whereas a violent war movie may not.

In addition, some evidence suggests that bad moods, either exacerbated by or independent of media choices, may be functional. In these cases, we are not motivated to terminate negative mood states, as suggested by mood management theory. Instead, we may in fact want to extend them. There are times, for example, when I may want to stew after being offended by someone, rather than being distracted from my bad mood. Thus, media violence may be functional in instances when I actually want to extend hostile or angry feelings. In keeping with this logic, Knobloch (2003) has refined mood management theory to include a state referred to as mood adjustment.

Mood Adjustment

There are undeniably times when negative mood states such as anger, sadness, or even stress may be either functional or at least appropriate. Intuitively, we seem to recognize when these negative mood states are called for and we make an effort to maintain the appropriate mood. Knobloch (2003) refers to this process as mood

adjustment and argues that we sometimes use media to maintain and adjust moods in anticipation of the situational requirements regarding mood. In one study, participants were angered by a confederate then led to believe that an opportunity to retaliate would or would not be imminent. For men led to believe they would have an opportunity to retaliate, they selected more hostile and bad news websites than those who did not think they would have the opportunity to retaliate. Thus, they opted to maintain their negative moods as a way of preparing for retaliation and thereby used media as a means of maintaining a hostile mood. Similarly, O'Neal and Taylor (1989) found that males were likely to choose violent, not soothing movies after being provoked by a confederate, but only when they believed they would see the confederate again. Therefore, one appeal of media violence may be that we consume it in order to maintain anger and hostility because we want to, for either real or perceived functional reasons. In other words, we may care to sustain anger because it seems functional to us if later, we can lash out at or harm the person who angered us in the first place!

In sum both mood management and mood adjustment suggest that we select media based on mood and arousal. How might these theories offer a framework for our understanding of the appeal of violent media? The arousal-based aspects of mood management are likely to help explain the appeal of at least some violent media because movies, television, and videogames that contain violence are often stimulating by nature. Fights, physical struggles, car chases, and danger are likely to increase physiological arousal levels through increased heart rate, galvanic skin response, and pupil dilation. Thus, it is not surprising that in order to manage low arousal levels, participants may seek out violent media or at least cite it as a reason to consume violence (Slater, 2003).

In terms of affect, violent media may offer aggressive participants the experience of hostile emotions in which they take pleasure (Slater, Henry, Swain, & Anderson, 2003) and may offer some validation for feelings of alienation that they experience (Slater, 2003). In either case, violent media may help sustain and even enhance aggressive feelings for people who want or need to feel these things. Whether violent media validate existing negative emotions, enhance noxious ones, provide for functional anger in individuals who perceive their anger *as* functional or encourage hostility when that is the desired outcome, it is important to stress that positive moods are not always perceived as desirable and violent media may help reach the desired outcome. Thus, theoretically (i.e., mood management, mood adjustment), empirically, and practically, the appeal of violent media may stem from our belief, however unconscious, that media help us control our arousal levels and affective states.

Disposition-Based Theories

One leading explanation for media enjoyment and thus for the attraction of media violence focuses on how individuals evaluate media characters, form affiliations with

them, and affectively respond to them. Although these theories can be applied to a vast range of content and in fact differ somewhat based on the type of content under consideration (Raney, 2006), here, we will focus on how our affective and affiliative responses to violent media and violent media characters occurs.

Affect is at the heart of disposition theories, with enjoyment of media and attraction to it driven by our feelings about a character. For example, Raney and Bryant (2002) found that liked characters' actions were interpreted positively and disliked characters' actions were interpreted negatively for the sake of maintaining audience's positive attitudes towards the character. Thus, viewers may accept and enjoy the violent actions of a liked character, especially when enacted against a disliked character. This would explain why audiences often cheer for the hero when s/he commits even brutal violence against the villain. Disposition theories would argue that the positive affective response to the hero would define the latitude of acceptance of the violence against the antagonist and thus, help shape the moral judgment. Violence in the name of a greater good (in this case, to harm the detested antagonist) is celebrated. It would not be enough to have the hero succeed; the villain must be vanquished. Violence is a very immediate and clear means to that end.

Although this may seem similar to the notion of "justified violence" in other research (e.g., Krcmar & Cooke, 2001), disposition theories focus on the relationship that the viewer forms with the violent actor, the protagonist. Thus, even in the case of unjustified violence (the hero may cast a final blow to the already-downed antagonist), the violence is enjoyed. According to disposition theory, then, violence is enjoyed when the viewer likes or identifies with the violent actor, regardless of the nature of the violence itself.

Functional Approaches

Although much research on the appeal of violent media has focused on the role that affect and arousal play in determining media choices, at least some research has considered how we might use violent media functionally, for example, in an effort to master threat (Sparks & Sparks, 2000).

Mastering Threat, Expressing Empathy, and Experimentation

Perhaps we consume violence because we are strategic in our media choices. Zillmann and Weaver (1997) argue that watching violence (in the case of their research, horror films) may offer males in particular an opportunity to show mastery over that which is considered distressing and frightening. Similar to Goldberg's (1998) proposal, discussed earlier in the chapter, Zillmann and Weaver (1997) suggest that modern society offers little opportunity to master real violent

threats: To be exposed to them, to understand them and to come to terms with our fear of them. Thus, media violence may be attractive because it offers a safe stand-in. Kuhrke, Klimmt and Vorderer (2006) refer to this as situational self-enhancement. They argue that playing violent videogames is functional in that it offers players an opportunity to gain a sense of power and control over their environment. In other words, violent game play offers an opportunity to compensate for perceived deficiencies in one's own life, whether those deficiencies arise from a lack of personal control (Kuhkre & Vorderer, 2006) or experiences of success (Klimtt, 2003). Jansz (2005) also underlines the possible role of affective mastery over threat through videogame play as a reason for its appeal; whereas Cantor and Nathanson (1997) suggest that children are attracted to violent media to deal with their fear responses to it. In fact, they have found that children who have been frightened by violent media in the past are more likely to seek it out again in the future, particularly when justice is shown being restored in the end, than those who have not been frightened in the past. Thus, it does appear that they are attempting to deal with their fear by not only watching violence repeatedly, but by demonstrating to themselves that in the end, it will all turn out fine.

These types of explanations are supported at least in part by research that consistently finds that males are more attracted to violent films, television and videogames than females are (Cantor, 1998; Sparks, 1991). In Western cultures, where male power and physical strength are valued, and where male success and achievement are often considered a measure of individual worth, it stands to reason that males would feel a need to overcome physically violent threats and to gain a sense of control over their environment to a greater extent than females.

Moral Disengagement

In addition, viewers may feel a certain moral disengagement *because* the violence is mediated and/or fictional. For example, videogames offer an ideal opportunity to morally disengage because of the very nature of the violence (Hartmann & Vorderer, 2010). Videogame violence is fictitious and unlike movies it does not (arguably) attempt to portray reality. With their interactive nature and potential to *be* the character, they offer yet another functional opportunity: To experience socially unsanctioned behavior without fear of social or legal retribution. In *Grand Theft Auto*, for example, players can not only drive dangerously, and enact violence on civilians and police officers, but they can pick up prostitutes and perform vandalism as well. In the case of videogames, one has the opportunity to not only watch behavior that one is unlikely to get away with in real life, but the player can actually perform it. This kind of behavior, including violence, is likely to be appealing to some individuals, thus functioning as a means of exploration with a safety net. Because players know that there are no real victims (at least not in the direct, immediate sense), they can morally disengage.

Personality Factors

Personality factors are broadly characterized as psychological dispositions towards media – those psychologically driven individual difference traits that influence attraction to violent media. For example, Weaver (1991) found that individuals who rated high on an index of psychoticism were attracted to graphically violent horror films. Another variable that has received much attention in the selective exposure literature is sensation seeking. Theoretically, sensation seeking is related to individuals' baseline physiological arousal levels and thus high sensation seekers have lower arousal levels and require more exciting and novel messages to attract their attention (Donohew, Finn, & Christ, 1988). Therefore, it is possible that at least some violence is attractive to high sensation seekers due to its graphic, novel and stimulating content. For example, Krcmar and Greene (2000) examined various personality traits and found that sensation seeking was related to adolescents' exposure to violent television. Other research into sensation seeking has also found that it predicts attraction to violent television and website content (Slater, 2003), and exposure to contact sports and real crime shows (Krcmar & Greene, 1999). These latter authors reasoned that high sensation seekers were "seeking out arousal that is produced by visually stimulating and unpredictable media content" (p. 40).

Krcmar and Keane (2004) explored additional personality correlates not only of exposure to violent media but enjoyment of it, as well. Interestingly, this research found that exposure and liking were not strongly correlated, suggesting that audiences may watch violence for reasons other than enjoyment. As discussed previously, if exposure is functional, audiences may consume media violence to fulfill some need without actually enjoying the viewing experience. Furthermore, there may be structural reasons for exposure to media violence. Perhaps my friends meet on the Internet to play a violent multi-player online game. I may enjoy playing with them, while not enjoying the violence *per se*. In any case, Krcmar and Keane (2004) examined the five major personality traits (Neuroticism, Extraversion, Openness to experience, Conscientiousness, and Agreeableness) and found that whereas neuroticism was related to exposure to violent films and television, including reality shows such as COPS and violent drama, neuroticism was unrelated to liking these genres. Extraversion was also related to exposure to violent films and television as were some dimensions of the openness to experience variable. Lastly, agreeableness was negatively related to exposure to violent media. In another study exploring personality and media choice, Slater (2003) found a positive link between adolescents' scores on an alienation scale and their exposure to violent films.

Thus, it appears that personality factors do in fact drive needs. For example, sensation seeking may drive a need for stimulation that can be sought out through violent media. More neurotic individuals may seek out violent media as a means of gaining a sense of understanding and control over their fear of violence. Those who rate

high on a scale measuring openness to experience may seek out violence as a mean of encountering novelty. And those who are dispositionally cheerful and agreeable may in fact *avoid* violent media because of its inherent incompatibility with their general personality and outlook. In each case, however, it is the personality factor that drives the need, which in turn drives the media choice. Interestingly, that choice may not actually fulfill that need, which may be why these viewers do not necessarily report enjoying what they have chosen.

Trait aggression has also been investigated in terms of attraction to media violence. For example, Atkin (1985) found a link between aggression and exposure to media violence. More recent research has continued to support this claim, even in terms of newer media. For example, both Slater et al. (2003) and Colwell and Payne (2000) found that those who are higher in trait aggressiveness are more likely to seek out and play violent videogames.

In order to synthesize the sometimes disparate literature on the link between aggression on one hand and exposure to media violence on the other, Slater and colleagues (2003) proposed a downward spiral model. Utilizing a cross-lagged panel design, they tested both the hypothesis that exposure to media violence caused aggression and that aggression encouraged interest in and exposure to media violence. Data gathered from the adolescents in the study support the notion of a feedback loop. Whereas trait aggression does encourage exposure to violent media, exposure to violent media appears to encourage aggressiveness. Hence, one variable reinforces the other in a downward spiral.

Despite the importance of these personality factors in determining interest in violent media, recall research by Krcmar and Keane (2004) found that although personality may influence exposure, exposure to violent media did not necessarily predict enjoyment. Thus, other factors, both sociological and merely incidental are likely to encourage exposure to media violence as well.

Social Factors Influencing Interest in Media Violence

Sociological or social factors can be defined as those that take into consideration the features of the environment, both the viewing environment and the individual environment, that influence media choice. In other words, I would define sociological factors as those variables that arise from cultural influences, family influences and those individual factors such as gender that are at least in part socially determined. For example, Robertson, Blain and Cowan (2005) found that adolescent choices of media were most strongly influenced by family and peer choices. Other social factors, such as gender, also play a role. Cantor and Nathanson (1997) found that boys were more interested in violent television than girls, a finding that has been consistently

upheld in the research (e.g., Atkin, Greenberg, Korzenny, & McDermott, 1979; Lyle & Hoffmann, 1972). However, biological sex is often a stand-in variable. That is, biological sex is statistically related to many variables, not least of which is the interest in and enjoyment of media violence, but it is likely socially constructed gender more so than biological sex that has explanatory power.

Williams and Clippenger (2002) offer evidence that suggests an interesting sociological explanation. In their research, males played violent videogames either against a computer or face to face, against a stranger. Participants were actually more aggressive and more competitive in the computer play condition than in the stranger situation, leading the researchers to argue that a need for competition drives interest in and in some cases outcomes of violent videogame play. Indeed, a social need to compete is one of the motivations suggested by those who play violent videogames (Sherry, Lucas, Greenberg, & Lachlan, 2006). Thus, one explanation for interest in, at least, interactive violent media is a coinciding interest in the competitive aspect of many violent games. The fact that males, on average, are more interested in competition, because they are socialized by perhaps family norms and participation in cultural activities such as competitive sports, is therefore spurious.

Do We Really Enjoy Media Violence? Incidental Motives for Exposure

Although evidence does seem to exist that humans are intrigued by, attracted to or just curious about violence, is it possible that producers overestimate this interest and thus create more of it than we want, making exposure somewhat unavoidable? After all, of the 10 most popular films in the USA in 2009, some were unarguably violent (e.g., *Transformers: Revenge of the Fallen*; *Harry Potter and the Half-Blood Prince*; *Star Trek*) others were not (e.g., *Up*, *The Hangover*, *Ice Age: Dawn of the Dinosaurs*) (<http://boxofficemojo.com/yearly/chart/?yr=2009&p=.htm>). Thus, it is possible that at least some of our exposure to violence could be incidental, co-occurring with some dramatic story line that we enjoy but not necessarily sought out because of the violence. After all, writers, directors and producers create films and programs based on what they hope audiences will watch, what they think audiences will watch and what they believe audiences will watch. Jordan and Woodard (1998) in their research in which they interviewed producers of children's programs, referred to this as conventional wisdom.

From those interview data, Jordan and Woodard (1998) determined which beliefs guided producers in the creation of programs. One belief that resulted in the production of violent children's programs was that "It is better to gear programs to a boy audience than a girl or mixed audience (p. 91)." Implicit in this assumption was that boys would certainly be attracted to violent programs and that girls would watch boy programs but not vice versa. Interestingly, the conventional wisdom that guided the production of children's programming was untested but strongly held by producers

and broadcasters. Thus, children were presented with violent programs, despite that the humorous ones might be as, or more appealing to them.

In addition to the fact that violence may be incidental to the program, individual exposure to violence may be incidental, or at least situational. For example, I may not enjoy violence but I may enjoy watching television or movies with my friends or family. When a violent movie is chosen by the majority, I watch because of my pleasure in the viewing situation, not because of my enjoyment of the violence or of the movie itself. Similarly, one motive for videogame play is that gamers may like the social nature of play. If the game happens to be violent yet provides the gamer with an opportunity to spend time with peers, once again, incidental exposure occurs. In any case, it is a mistake to assume that all exposure to violence is both intentional and due to the violence. After all, Krcmar and Keane (2004) found that exposure to violence and enjoyment of violence were statistically only very weakly related statistically.

Understanding Interest in Media Violence: Some Tentative Conclusions

So why are audiences attracted to violent media? Why do they consume it? And what sense can we make of the disparate lines of research and the assortment of variables and theories that attempt to explain the phenomenon? In turning to only affect and arousal-based theories such as mood management and mood adjustment, we ignore the very real role that the external environment such as peer norms may play in our attraction to media violence. On the other hand, threat mastery and other functional explanations offer some explanation for violent media use but tend to be somewhat narrow in their explanation. Each approach alone suffers from focusing too intently on a set of variables or causes to the neglect of others. What is needed is a broad theory, even a meta-theory that can provide an umbrella to link the reviewed theoretical approaches and variables under investigation. In the next section, I will propose a model that will help to integrate the various theoretical and empirical approaches to the study of attraction to violence and encourage scholars to utilize this broad-based approach in future research.

Social Cognitive Theory

Bandura's (1986) social cognitive theory remains one of the most influential theories in social psychology and has been widely adopted by scholars of media (Chapter 4, this volume). The intent of this section is by no means to offer a history or summary of the theory (which was well done elsewhere: Pajares, Prestin, Chen, & Nabi, 2009).

Instead, I will assume a basic understanding of the learning theory and attempt to point out some links between it and the research on selective exposure to media violence (see also LaRose, 2009). In short, social cognitive theory, in its 40-year evolution, attempts to explain the learning and enactment of human functioning that proposes that this functioning is the result of reciprocal determinism, or the bidirectionally linked interplay of three categories of variables. These include personal factors (such as affect and cognition, because they are individual difference variables, specific to the individual), environmental factors (both situational and environmental as more broadly defined), and behavior. Because media choice, and the selection of violent media in particular is, obviously, a behavior enacted by humans, it seems clear that those factors that influence it might fall under social cognitive theory. After all, the theory deals with the factors that drive or influence human behavior, of which media choice is one example.

From a sociocognitive perspective, we might categorize the various theories and variables we have discussed as falling under personological factors, environmental factors and behavioral factors. Specifically, we have discussed affective and arousal-based theories, as well as the desire to master threat. These could be construed broadly as personological factors. Similarly, personality factors that influence attraction to violent media (e.g., sensation seeking, neuroticism) also fall under the category of personological factors, as does gender. Environmental influences on attraction to media choice include sociological factors such as peer interest in media violence, family norms of exposure to media violence, and incidental factors, such as what programs, videogames and films are available at a given time. Lastly, selective exposure to media violence is clearly a human behavior or function. As proposed by Bandura (1986), these three categories of variables are bidirectionally linked and thus, reciprocally influence one another. For example, the environment (who I am with, what media are available) has an effect on my affect and perhaps my arousal. Affect and arousal, in turn can influence my interactions with my environment in a given moment. Both of these factors: Personological and environmental, then, can influence selective exposure to violent media in that given moment, which in turn, obviously, influences my affect, arousal and perhaps my interactions with that environment still further. Hence, the three categories of factors are reciprocally linked (see Figure 8.1).

Thus, to the extent that social cognitive theory can be thought of as a meta-theory, or even meta-approach to the exploration of human behavior, it offers us at least a starting point, a framework, for understanding the interplay of factors that influence selective exposure to media violence. In sum, we consume what we do due to factors relating to us as individuals, both momentary, state factors such as affect and long-term, trait factors such as personality variables; we consume because of our environment, friends, parents, the situation, and these all result in consumption of violent media. To consider any of these alone, or even to consider one as primary, is to engage in a reductionism that is tempting, but ultimately, not explanatory to understand the complex appeal of media violence.

Figure 8.1 Bidirectionally linked factors predicting selective exposure to violent media: adapted from social cognitive theory (based on Bandura, 1986).

Media Message Processing and the Embodied Mind

Measuring Bodily Responses to Open the Black Box

Annie Lang

ABSTRACT

This chapter critically reviews research which uses physiological and behavioral measures as covert, real-time measures of motivated cognitive processing. It is written from the common perspective in psychophysiological research that the mind is an embodied organ and therefore is sustained by the body. As a result, things which occur in the mind can be “seen” in the body. Thinking, feeling, and being are all dependent on the continuous electrical, chemical, and biological functioning of the brain. As the amount of thinking and feeling varies, so do the metabolic demands of the brain. As those metabolic demands vary, so does the autonomic functioning of the body. Careful measurement of bodily responses in controlled contexts can yield fine-grained information about thinking and feeling. Recent research has applied these measures to the problem of understanding media psychology. This chapter will discuss how variations in media structure and content influence motivational activation, which in turn influences emotional responses and cognition, and how psychophysiological and behavioral measures can be used to track the real-time processing of mediated messages.

Mind, Body, and Media

This chapter takes the perspective that the embodied mind meets mediated messages in specific local environments embedded in culturally imbued social systems. The perspective is one of systems within systems; the cognitive system is embedded in a motivational system, which is embedded in a biological system, which is embedded in a social system, which is embedded in the cultural system. Further, it is assumed that all these systems are continuously interacting with one another over time creating one large and many smaller dynamic systems. Within this perspective, the task of the communication scholar is to understand the interactions between and within one or more of these systems (Lang & Ewoldsen, 2010). The chapter focuses on the interactions between the cognitive and motivational systems within the biological system. This is not to say that the interactions of these three systems with the local environmental system or with the larger social and cultural system are not important or interesting. It is simply to admit that focusing merely on these three systems is sufficiently complex for a start.

In many ways, this perspective is antithetical to traditional approaches to studying mediated messages (Lang, 2011). First, it eschews traditional distinctions not only between media but also between mediated and interpersonal communication. From this perspective all stimuli are messages and all messages are mediated by the sensory, cognitive, motivational, and biological systems in which a conscious mind emerges. Second, it denies the existence of stability and of effects and puts in their place the concept of continuous dynamic change in which certain patterns of interaction among systems are more stable and more likely while other patterns of interaction among systems are less stable and less likely. From this perspective, a purposive strategic mediated message propagates through the systems and through time causing variation in the interactions within and among the systems both in real time (what one might call the online processing of, or interaction with, the message) and, following the conclusion of the message, in some kind of internal system time where information gleaned from the message becomes part of the system and influences future interactions among all the systems. Thus, information (in a very catholic sense) which has been, perhaps purposefully, perhaps not, placed in a message (by the world, by a producer, or by a single human being) causes immediate and somewhat predictable real-time variation in the sensory, motivational, and biological systems which encounter it, whose function is to support the perception, encoding, and storage of an idiosyncratic mental representation of that information. Introduction of this information into the system thereby changes the system and all its future behaviors, though the extent of those changes is certainly dependent upon the nature of both the information and the message that delivered it. This perspective places communication at the intersection of the biological/motivational/cognitive system and the message.

Truly accepting a dynamic systems perspective makes the actual time during which the interaction between a person and a message is occurring of primary importance. Given that we can control the structure, the timing, and the content of the message we have an opportunity, as researchers, to “observe” how the system responds to the introduction of the message. To the extent that we can observe each of the nested systems (motivational, cognitive, biological) interacting with and responding to the message, we can come to understand, explain, and to some extent predict and potentially change the system. Time is of primary importance because change within the message from one moment to the next results in subsequent change within the tripartite human system from one moment to the next, which alters how the system interacts in the next moment with the changing message. Research from this perspective can eventually learn how variation in a myriad of structural and content features of messages can drive the motivated cognitive system towards different trajectories of interaction which may be desirable.

Studying communication this way requires the ability to track changes in messages and changes in the motivational, biological, and cognitive systems in real time and the development of theories, methods, and strategies for examining the interactions among them. In this way, we can begin to understand how certain types of content or structural features in messages predictably influence dynamic change in the biological motivated cognitive system that is a message recipient. To do so requires dynamic measures of both change in messages and change in the human-motivated cognitive system.

Given that this perspective is based in part on currently popular and historically venerable non-Cartesian traditions in psychology, epitomized by psychophysiology (Cacioppo et al., 2000), which views the brain as an embodied organ inextricably linked in to bodily functions which both support and reflect its activity, physiological measures seem a natural tool to use to provide a window into the operations of the motivated cognitive system. Psychophysiology is the science of linking physiological measures with psychological correlates (Cacioppo, Tassinary, & Bernston, 2000). It is important to fundamentally understand that physiological measures are indeed measures of variation in physiological systems. That is they are measurably precise veridical (exact and actual) measures of the operation of some specific aspect of physiology such as voltage potential in a muscle, electrical conductance across a variably moist surface, or the opacity to infrared light of a portion of the body. And they measure these within some specific and known margin of error both for the measure and across time. The measurement task is merely engineering. The science is in the work that has been done over the last hundred or so years to determine, in specific environments, how, in response to a controlled stimulus, these aspects of the biological system that we can measure correlate with theorized motivational, emotional, cognitive, and behavioral responses to that stimulus – hence the term *psychophysiology*.

In other words, physiological measures do not provide an actual specific record of specific psychological states. Rather, in known circumstances with understood

stimuli, they are indicators of psychological states. Research in psychophysiology has demonstrated large and robust correlations between specific stimuli and specific physiological responses in specific controlled environments. Over the last 30 years a fair amount of work has been done to translate that work into the communication laboratory (Lang, 1994a). This has entailed enlarging the range of stimuli from simple tones, words, and images to dynamic audio and visual stimuli of all sorts and ascertaining whether these known large and robust correlations between stimuli and physiological measures hold in the more chaotic environment of the media message. In addition, while change over time is an essential part of the psychophysiological tradition, work with media has necessarily enlarged the timeframe from milliseconds and seconds to minutes and hours. Thus, importing psychophysiological methods and theory into communication research has entailed an increase in the complexity of the stimuli and of the measurement and a concomitant decrease in control over many aspects of both the stimulus and the response. Despite these difficulties, it has also provided us with the ability to observe and learn from real-time interactions between messages and the motivated cognitive system.

As may be clear from this introduction, both the observation and interpretation of the measures are necessarily theory driven. While a statement about an increase in activation in a facial muscle might be thought of as a simple observational statement, taking the next step, and claiming that it represents a change in an emotional or psychological state requires a theory of cognition, a theory of emotion, and a theory linking the stimulus properties of the message to cognition and emotion. Much of the research discussed in this chapter and much of the importation of various physiological measures into communication research has been done either in conjunction with the development of or under the auspices of the Limited Capacity Model of Motivated Mediated Message Processing or LC4MP (Lang, 2000, Lang, 2006a, 2006b). This model draws heavily on theoretical programs in psychology (Kahneman, 1973; Shiffrin & Schneider, 1977), psychophysiology (Cacioppo & Sandman, 1981; Greenwald, Hamm, Bradley, & Lang, 1988; Lang, Simons, & Balaban, 1997b), and communication research (Bryant, Carveth, & Brown, 1981; Zillmann, 1982a). Its primary pieces were developed by others and integrated and applied to communication in an attempt to explain the real-time dynamic interaction between messages and the human biological, motivated, cognitive system. This chapter lays out the LC4MP, the embedded use of psychophysiological measures in communication, and discusses potential developments in this area.

The Theoretical Model

The *LCModelMMMP* presents a plausible explanation for how information moves from the message to the mind. The model is itself dynamic, minimalist and data-driven and seeks to remain compatible with our ever-increasing understanding of

neuro- bio- cognitive- psychology. As a result of these characteristics, the model incorporates the fewest possible theoretical variables and concepts needed to accomplish its task and strives to develop, for each concept, at least one specific measurement. Thus, unlike traditional effects research, where something about a message is manipulated and something about a person is measured after the message has been consumed, and these pre- and post-data are used as supporting evidence for what occurred in between; LC4MP attempts to measure every hypothesized dynamic interaction between the message and the motivated cognitive system in real time.

The **LCMMMMessageProcessing** takes the perspective that humans have a cognitive system capable of performing at least three specific processes, embedded in a motivational system designed by evolution to promote survival, embedded in the physiological and biological system which is the body. Variations in any of these systems caused by external (as in a mediated message or a conversational partner) or internal (as in a thought or an upset stomach) stimuli have immediate impact on the functioning of the cognitive system. The three specified processes in the cognitive system are encoding, storage, and retrieval.

Encoding is the idiosyncratic non-veridical process by which information contained in the external world (e.g., the mediated message) is turned into a mental representation. There are three important things to understand about this process. First, it occurs over time. This means that the amount of time the system has to encode a message significantly impacts the amount of information that is incorporated into the resulting mental representation. Second, encoding is non-veridical: Eyes are not cameras and ears are not audio recorders. Rather, seeing and hearing are driven by both hard- and software. They are constructive processes, which rely on the external information in the world and internal information which has been learned over a lifetime of interaction within and with the world. Thus, encoding produces not an exact representation of reality but rather a constructed one. Further, the construction rests not only on information from the external world but also on the experiences of the encoder. Thus, each person's representation is idiosyncratic. The aspects of the external stimulus selected for encoding will vary based on the interests, knowledge, and background of the person doing the encoding. This is not to say that each person will encode a completely unrelated representation of a given stimulus because the evolutionary mechanical characteristics of the biological system will ensure the encoding of aspects of stimuli directly related to survival. Similarly, psychological characteristics of stimuli will elicit from all encoders various automatic and reflexive cognitive and motivational responses, which ensure their inclusion in the final representation. Hence, the core of encoded representations, those aspects related to the basic functioning of the motivated cognitive system, will be there for everyone. What will vary between people is the selection from the myriad of other details which accompany that basic psychological core. Thus, when a fast-moving car comes screeching around the corner, careers off a lamp post, and rockets out of sight down an alley, all observers will report accurately that it was a vehicle, that it was fast-moving, the general direction from which it came, and more accurately the direction

in which it disappeared. Other details will depend on the observers. Car buffs may report on make and model, an artist might notice the color, the off-duty policeman may come up with a license plate number, and inveterate people watchers may notice something about the driver. These people will be selecting the details that are associated with how they have learned to see the world.

Storage is the process by which encoded mental representations become part of what a human knows. The LC4MP considers memory to be essentially neurologically based. It is likely that what a person is thinking about at any given time corresponds to the set of activated neurons which make up the representations of those things. Neurons which fire together, wire together and likely form in some way the neurological basis underlying association models of memory. The LC4MP does not endorse a specific model of memory but rather assumes that simultaneously active memories become linked and that activation can spread through the memory network. Thus, encoding creates an active mental representation of what is occurring in real time. Aspects of the external stimuli which are related to or match information already known activate their stored mental representations during this process and the simultaneous activation links the new information to the old. The process is largely automatic though people can work to increase the efficiency of the storage process.

Retrieval is the process of activating previously stored information. It happens automatically in response to stimuli in the external world (e.g., when you see an elephant, you effortlessly retrieve the label elephant and the knowledge that it is a grey animal with a trunk, etc.) and it can happen under the control of a person trying to remember what they know (e.g., can I remember if it is Indian or African elephants that have big ears?).

The *LimitedCapacity*4MP also argues that people do not have an unlimited ability to take in, store, or retrieve information. The model conceives of humans as limited capacity processors and conceptualizes attention as the allocation of this limited capacity of processing resources (Grimes & Meadowcroft, 1995; Kahneman, 1973; Lynn, 1966; Ohman, 1979; Reeves et al., 1985; Wickens, 1984). As a result, what is encoded, what is stored, and what can be retrieved is only a subset of the information contained in the world or in a mediated message. Many aspects of the environment, the processing system, and the message directly influence how these capacity limitations impact our ability to perceive, comprehend, and remember the information contained in messages. Among the most important external variables are the amount of information, the rate of information presentation, and the motivational relevance of the information. Among the most important internal variables are practice, prior knowledge, and expertise.

The model theorizes that limited cognitive resources are allocated independently (through both automatic and controlled mechanisms) to encoding, storage, and retrieval. Aspects of the environment which represent change, often associated with novelty (e.g., someone opening a door or the sound of a car starting) or that are learned signals of import (e.g., your name or a siren) elicit orienting responses (ORs)

and thereby the automatic allocation of resources to encoding. Aspects of the environment that are related to threats and opportunities automatically elicit motivational activation and thereby the allocation of resources to encoding and storage. When more resources are required to process a stimulus than have been allocated, processing performance is impaired and a form of cognitive overload occurs.

Within the LCMM*Mediated*MP encoding, storage, and retrieval, though capable of being influenced by intent, generally operate automatically and outside conscious awareness and control. Further, these are primitive, built-in, biologically based cognitive mechanisms developed by evolution and not subject to change within the relatively short time encompassed by human history. For this reason, a primary assumption of the LC4MP is that these processes initially respond to mediated stimuli as if they were real (Reeves & Nass, 1996). Certainly, as people interact with mediated stimuli their conscious knowledge that they are not in fact precisely “real” does function to influence these responses and alter how the system is operating. However, they cannot stop these processes from operating, they can only inhibit, shift, or facilitate them.

Finally, the LC*Motivated*MMMP theorizes that the cognitive system is embedded within a biological motivational system that was designed by evolution to promote survival of the species and the individual. The motivational system consists of two independently operating systems, the appetitive or approach system and the aversive or avoid system (Cacioppo & Gardner, 1999). Activation in these systems varies continuously across time in response to external and internal stimuli representing threats and opportunities. The *appetitive* system activates in response to opportunities while the *aversive* system activates in response to threat. At any given time, the environment may contain threats, opportunities, both or neither. For this reason, the systems’ activation levels vary independently and automatically as needed. The two systems have somewhat different operating characteristics. Neither system is ever off; however there is a very low level of activation, which we might think of as idling. Dual systems theory suggests that in a neutral environment (e.g., one with no threats and no opportunities) both the appetitive and the aversive system will be idling, and, when that occurs, the activation in the appetitive system is greater than that in the aversive system. The difference between these two is called the positivity offset and its theorized purpose is to ensure that people will venture out into the world to search for opportunities. To make up for this lower level of idling activation, the aversive system is thought to react more quickly and more vigorously to potential threats. This characteristic is called the negativity bias. Its primary purpose is to ensure survival through swift threat avoidance, it being best to avoid probable threats first and think about it later rather than to fail to avoid and thereby think no more.

In addition to motivating behavior (e.g., approach and avoidance) the motivational systems are also theorized to motivate cognition (Lang, Bradley, & Cuthbert, 1997a). That is, at the same time that motivational activation may be driving increased blood flow to the muscles or the brain to support running or thinking; it is also fine tuning the distribution of finite cognitive resources among the processes involved in

thinking about the world (e.g., encoding, storage, and retrieval). Appetitive or approach activation is theorized to be strongly associated with information intake as information increases our ability to take advantage of opportunities. Thus the model predicts that as appetitive activation increases more cognitive resources are allocated to encoding and storage external information. On the other hand, aversive activation is primarily related to avoiding threat. Therefore, at low to moderate levels of aversive activation, where there are only potential, not imminent, threats, resources are allocated to scanning the environment and taking in information. However, once a threat has been identified, as danger becomes more immediate, resources are withdrawn from the task of taking in additional information about the threat, and are allocated instead to the internal tasks of retrieving information about how to respond in the current environment, and towards making decisions about what to do (Yeghiyan & Lang, 2010).

In the context of communication research, this means that messages which contain motivationally relevant content automatically activate the motivational systems resulting in a change in how the cognitive system distributes its finite resources and therefore a change in the amount of information which is encoded, stored, and retrieved. Motivationally relevant content includes any content that represents threats or opportunities. Some motivationally relevant content is determined by evolution, these things represent hardwired threats and opportunities. Hardwired opportunities include food and sex. Hardwired threats include signs of distress (screaming, weeping), fast onset stimuli, and intense (e.g., very loud, very bright, very smelly) stimuli. Thus, messages which contain strong emotion, food, naked people, high-intensity fast-moving action, snakes, spiders, and so on, are likely to elicit automatic motivational activation in most users. In addition, people learn through experience to associate motivational activation with a myriad of objects, words, expressions, places, and things. Some of these associations are cultural, some are specific to a given social system, and some are purely personal. Once learned, however, these things also automatically elicit motivational activation.

The Operational Model

As stressed above, all of this theorizing is not worth much if there are no measures associated with the various parts of the model. A set of cognitive and physiological time-based measures shown to be correlated with the motivational and cognitive processes discussed above have been developed, borrowed, and adapted for use in the communication laboratory. Many of these measures are familiar to communication researchers. However, because of the dynamic nature of the theory they may be employed somewhat differently when used from this theoretical perspective. For example, rather than looking at the average of the measure over an entire message, these measures are tracked over the time-course of the message and the over-time

interactions between change in the message and change in the motivated cognitive system are assessed. This allows for the measure of real-time, dynamic processing of the message.

In addition, research from this perspective requires dynamic measures of psychologically and motivationally relevant aspects of mediated messages since it is necessary to track the variation in signal, novel, and motivationally relevant information within the message as well as the change in variables related to the level of resources required to successfully encode and store the information contained in the message (Detenber & Lang, 2011). The next section will first present the motivated cognitive measures and then the dynamic message measures.

Motivated Cognitive Measures

The model as presented above makes predictions about motivational activation, orienting responses, resource allocation, encoding, storage, and retrieval. Therefore it requires dynamic measures of appetitive and aversive activation, encoding, storage, and retrieval, and the allocation of finite processing resources.

Encoding, storage, and retrieval performance are indexed by recognition, cued recall, and retrieval, respectively (Lang, 2000; Zechmeister & Nyberg, 1982).

Recognition is measured by presenting participants with an exact representation of what they saw or heard and asking them to decide whether or not they saw it. When measuring recognition it is not necessary for the participant to locate or retrieve information, they need only to perceive the stimulus and decide if they have seen it before. This is an appropriate measure of encoding, because people encode a great deal more information than they actually successfully store or can retrieve, but the process of encoding information leaves behind a residue of familiarity that allows people to determine, with remarkable accuracy, whether something has been seen before. Thus, accuracy on recognition tests is a good indicator of encoding performance. In addition to accuracy, signal detection analysis can also be used which takes into account the decision-making process involved in giving a “yes/no” answer and results in two measures, *D prime* which is an indicator of encoding performance and *criterion bias* which is an indicator of the level of familiarity required by the participant in order to give a “yes” answer (Fox, Park, & Lang, 2007; Shapiro, 1994). For example, a person has a certain sense of familiarity about a recognition target – if there is a reward for getting the right answer and no punishment for getting it wrong, people will have a bias towards saying “yes I saw that before” at a lower level of familiarity. Obviously, if being wrong is punished, they will have the opposite bias.

Cued recall measures are used as an indicator of storage. Cued recall procedures require that the participant be provided with a specific cue to the location of the detail you wish them to remember. In this case, the participant does not have to find where in-memory information is located, but needs to provide only the detail. Fill in the blank questions can be used to create time-locked cued recall tests.

Finally, *retrieval* can be indexed using free recall measures; people are asked to recall everything they can about a stimulus. This information can be coded as to when it occurred in the message providing an over-time retrieval measure. However, this technique only assesses retrieval of a message after it has been seen. The model also posits that during message processing people engage in concurrent retrieval. That is, they are calling up information from memory that is relevant to processing the current information. At this time, the model does not have a measure of concurrent retrieval.

The allocation of processing resources is assessed in a number of ways. First, secondary task reaction times (STRTs) have been used as an indicator of resource allocation (Lang & Basil, 1998; Lang, Bradley, Park, Shin, & Chung, 2006). In this paradigm, participants carry out a specific task (e.g., watching a mediated message). Periodically, a signal occurs to which they respond, usually by pushing a button, as quickly as possible. The speed with which participants respond to the periodic signal indicates the level of resources allocated to encoding the mediated message but not required for that task, called available resources. Message processing, in particular encoding, is thought to be highest when available resources are high and lowest when available resources are low or nonexistent. Structural and content features of the message contribute both to the number of resources allocated to processing the message (as a result of signal, novel, and motivationally relevant content which automatically elicit resource allocation) and the number of resources required to process the message (as a result of complexity and difficulty). Thus, the level of available resources is dynamically changing over the course of the message in response to these content and structural features. Probes are placed periodically and strategically throughout the message in order to test predictions about level of available resources as a function of message structure and content.

Within the LC4MP, variation in resource allocation during media use is also indexed by heart rate (Lang, 1994b). Parasympathetic innervations of the heart result in heart rate deceleration during periods of intense attention to external stimuli. Heart rate can be measured time-locked to media messages and analyzed in such a way as to provide information on both short-term, called phasic, and long-term, called tonic, variations in heart rate thought to be correlated with short- and long-term changes in resource allocation. Heart rate provides a more continuous and dynamic measure than STRT.

Messages contain both structural and content features, which introduce signal or novel content and therefore elicit orienting responses. Orienting responses result in a short-term increase in resources allocated to processing incoming stimuli and are indexed by a phasic (5 to 7 seconds) slowdown in heart rate. This short-term heart rate deceleration can be measured at specific points in messages where orienting is thought to occur. Over longer periods of time, sustained long-term deceleration in heart rate has been shown to be correlated with increased cognitive effort (defined in the LC4MP as total resources allocated to processing the message). Thus, by looking at the overall change in the trend of a heart rate series and the phasic

variation in heart rate around that trend, one can index both short- and long-term changes in resource allocation.

Motivational activation is assessed using a set of physiological correlates of motivational activation developed in research done to explicate dimensional theories of emotion (Bradley & Lang, 2000; Lang, Gilmore, Cuthbert, & Bradley, 1996). Within these theories, emotional experience is mapped onto two primary dimensions, arousal (ranging from calm to excited), and hedonic valence (ranging from unpleasant to pleasant). These theories posit that emotion arises as a result of underlying activation in the appetitive and aversive motivational systems. The direction of motivational activation, to approach or to avoid, maps onto the hedonic valence dimension. The extent of activation maps onto the arousal dimension. Research from this perspective has shown that aversive and appetitive activation are correlated with self-reported unpleasant and pleasant emotion, respectively. In addition several physiological measures including facial electromyography (EMG) (Bolls, Potter, & Lang, 2001), skin conductance (SC) (Lang, Bolls, Potter, & Kawahara, 1999), startle, and post-auricular response (PA response) (Sparks & Lang, 2010) are correlated with activation in the motivational systems.

EMG measures electrical activity in the facial musculature. Activation in three primary facial muscle groups has been shown to be correlated with emotional experience and, presumably, the underlying motivational activation. Measurable variation in the electrical activity of these muscles occurs long before there is visual change in facial expression. Activation in the corrugator muscle group, located to the inside of the eyebrows and involved in frowning, is correlated with negative emotional experience and aversive activation (Bolls & Lang, 2003). Activation in both the zygomatic major muscle group (located on either side of the mouth and involved in smiling) and in the orbicularis oculi muscle (which rings the eye) is correlated with positive emotional experience and appetitive activation. Facial EMG measures can be collected time-locked to media use allowing the assessment of moment-by-moment change in response to real-time change in messages.

Startle and PA responses are probe measures thought to reflect activation in the aversive and appetitive systems. The startle response is a primarily aversive response which is elicited by zero-rise time (i.e., stimuli which reach their maximum level almost instantaneously) or extremely intense (e.g., loud, bright, etc.) stimuli (Lang, Bradley, & Cuthbert, 1990). Startle responses vary from quite small to what is called the whole body startle. Their primary purpose is to interrupt ongoing processing, force the processing of a potential threat, and physically protect the body. An obligatory eyeblink is one component of the startle response. In the laboratory, startles are elicited by a very brief no rise-time burst of white noise. Electrodes placed on the orbicularis oculi muscle are used to measure the contraction of the muscle, which results in the eyeblink. The size of the blink is correlated with aversive and appetitive activation. At low levels of aversive activation startles are small, at high levels of aversive activation they are large. At low levels of appetitive activation startles are small and at high levels of appetitive activation they are even

smaller. Aversive activation is thought to facilitate startle while appetitive activation inhibits it.

The PA response is thought to have been correlated primarily with appetitive activation (Sparks & Lang, 2010). The electrodes placed on the post-auricular muscle, located behind the ears, measure contractions elicited by the same white noise probe that elicits the startle. PA responses are small during aversive activation or low levels of appetitive activation but much larger during high levels of appetitive activation.

Both PA and startle responses are probe measures, like STRT, which means they can be placed at strategic points in a mediated message to provide information about appetitive and aversive activation at a specific moment in time. Multiple probes placed over the course of the message provide insight into variation over longer periods of time.

The arousal dimension of emotion, thought to be indicative of activation in the appetitive and/or aversive motivational systems, is correlated with skin conductance (SC). SC is measured by running a very slight DC current between electrodes placed on the palm. Increases and decreases in the sympathetic division of the autonomic nervous system, correlated with the experience of arousal, result in the raising and lowering of the level of sweat in the eccrine sweat glands. Thus, with increasing sympathetic arousal, the level of sweat in the glands rises, resulting in faster conductance of the current across the surface of the hand, and thereby increased skin conductance.

Heart rate, skin conductance, facial EMG, startle, PA response, and STRT can all be measured time-locked to use of a given medium providing a picture of moment-by-moment change in appetitive and aversive activation and resource allocation. After media use, memory measures which track recognition, cued recall, and free recall for information occurring at specific time points over the course of a message, can provide us with an over-time assessment of cognitive processing. This information can then be used to assess the dynamic interactions between the medium and the motivated cognitive system. Future research in this area should continue to search for more and better indicators of the important processes and mechanisms posited by the model. Indeed some recent research has begun looking at functional magnetic resonance imaging (fMRI) as an indicator of motivational activation during risky behavior (Potter, Lang, Brown, Fukunaga, & Krawitz, 2008b).

Dynamic Message Measurements

This brings us to the problem of how to measure dynamic change in psychologically relevant aspects (that is those that are thought to influence the motivated cognitive system) of mediated messages. LC4MP is primarily concerned with three types of psychologically relevant message information: (1) those aspects of a message which elicit orienting (e.g., signal and novel stimuli or structures), (2) the amount of information in the message requiring resources in order to be processed (e.g., complexity,

difficulty), and (3) motivationally relevant information (e.g., speed, rise time, pleasant and unpleasant information).

Because LC4MP theorizes that novel and signal aspects of mediated messages will elicit orienting responses which result in an increase in resources allocated to processing, we need to know which aspects of each medium function as novel and signal stimuli and to have a dynamic measure of these elements. The first step in developing these measures is to determine which aspects of any given medium elicit orienting. To date, research has developed a list of both content and structural elements in several media that have been shown to elicit orienting responses, these elements are called orienting eliciting structural features or OESFs. For example, in TV, camera changes, movement towards the camera, certain changes in form, and some forms of camera movement have been shown to elicit orienting responses (Lang, 1990). In web-based media, the appearance of emotional pictures, warnings, and animation have been shown to elicit orienting (Lang, Borse, Wise, & David, 2002). In audio messages, sound effects, emotional words, and voice changes have been shown to elicit orienting (Potter, Lang, & Bolls, 2008a). Given the list of OESFs for a medium, any media interaction can be coded over time for their occurrence. Each OESF represents a point in time when additional resources are allocated to encoding the message. Thus, the more OESFs there are, the more resources are automatically allocated to processing the message. In addition, there should be an increase in resources allocated immediately following each OESF.

Of course, while, in general, having more resources allocated should increase message processing, the actual relationship is also dependent on the number of resources required to process the information immediately following the OESF. When messages are more difficult or contain more information they require more resources to be successfully encoded. Therefore, a second measure, called information introduced (ii) is paired with the OESF measure (Lang et al., 2006; Lang, Park, Sanders-Jackson, & Wilson, 2007). The information introduced measure assesses the amount of information present before and after each OESF on a number of dimensions (five for audio information and seven for video information). The more dimensions of information present following an OESF, the greater the resources required to process it and the fewer the available resources. Combining the information introduced (resources required to process the message) and OESF (resources allocated to processing the message) measures results in an over-time measure of predicted available resources. One such recently developed combination measure is called the dynamic audio/video redundancy and complexity measure (DAVRC) (Lee, 2009). This measure produces a ratio of OESFs and a measure of the dynamic variation of information introduced for every 4 seconds of a given message. Recent research shows that it successfully predicts variation in secondary task reaction times and encoding over time within a message.

Finally, LC4MP posits that motivationally relevant material in messages will result in the automatic activation of the motivational systems, which automatically increases and redistributes the allocation of resources to message processing. Thus,

we need a dynamic measure of the motivational relevance of the information contained in messages. Research from the LC4MP perspective has taken two approaches to this problem (Lang & Ewoldsen, 2010). First, coders have been asked to identify messages, or portions of messages, as containing or not containing motivationally relevant information. However, the resultant measure is far from dynamic. A second approach is to have groups of subjects view the messages and continuously rate their emotional responses (Biocca, David, & West, 1994). Specifically, one group rates how positive and another rates how negative they feel while engaging with the message. The resultant continuous response curves provide an average rating of pleasant or unpleasant emotional experience for each second of the message. These can then be used as dynamic indicators of the amount of appetitively or aversively relevant information contained in a message (Wang, Lang, & Busemeyer, 2011).

Putting it All Together

This combination of theory, over-time message coding, and time-locked measurement of the motivated cognitive system allows us to answer questions about the real-time interaction of dynamically varying messages and the motivated cognitive processing system. For example, in a recent study, stimulus messages were selected based on the dynamics of their motivationally relevant information. Messages were chosen which began neutral and became either increasingly positive (called positive) or negative (called negative), or began neutral and simultaneously became increasingly positive and negative (called coactive). Figure 9.1 shows the relevant continuous response curves.

Participants then viewed the messages while STRT, startle, PA response, facial EMG, SC, and HR data were collected. Among the theoretical predictions were that appetitive and aversive activation should increase and decrease following similar increases and decreases in the continuous response measurement (CRM) measures

Figure 9.1 Continuous response measures of positivity and negativity.

Figure 9.2 Corrugator activation.

of positive and negative motivationally relevant information. A research question asked what would happen during coactive messages. Figure 9.2 shows results for the corrugator muscle activation which increases during aversive and decreases during appetitive activation. At the end of the message, when the messages were highly pleasant, unpleasant, or both, this muscle was highly active during negative, inhibited during positive, and in between during coactive messages. In addition, during the first startle period, when messages were relatively unemotional, there is little variation in the startle response. However, for the second startle probe, when the messages are highly emotional, startle is facilitated for negative, and inhibited for positive messages, with coactive in between.

Average measures, over time, would not have allowed the mapping of the rise in appetitive and aversive activation following emotional content. Other analyses can be done to begin to investigate the lag between message and physiological change (Yegiyan et al., 2008).

Another approach is to create models that predict physiological and behavioral responses based on continuous motivational inputs. The Dynamic Motivational Activation Model (DMA) uses continuous ratings of arousal, positivity and negativity to predict variation in skin conductance, heart rate (HR), and facial EMG (Wang et al., 2011). The model predicts between 60% and 90% of the variance in the physiological data and estimates lag times between message change and physiological change by measure.

The Future

Obviously, research from this perspective has only begun to scratch the surface of the study of communication as a fundamental human process that operates in a nested series of dynamic systems. It is worth noting here, that this model, despite its fundamentally different conceptualization of the nature of communication, does not stand in opposition to more traditional effects theories and research. Indeed, it is hoped that it can begin to shed light on the underlying mechanisms which cause some well-documented communication effects. Examples of such attempts to meld the approaches can be seen. For example, Bradley (Bradley, 2007) has shown how this approach can produce a cognitive model that displays cultivation effects. Similarly, Bucy (Bucy & Bradley, 2003, 2004) has used this approach to examine unconscious processing of political messages. It is hoped that more research will also begin to reconceptualize traditional areas of communication research and approach our field not as arbitrary beginnings, endings, and resultant effects, but rather as a continuously modifiable input into a system that can alter its patterns, resting points, and outputs. To do otherwise is to miss the beauty and complexity of this very human behavior that we study.

Thoughtless Vigilantes

Media Violence and Brain Activation Patterns in Young Viewers

John P. Murray

ABSTRACT

There is a long history of research on the topic of the impact of media violence and children. Concerns first surfaced in the early 1900s with questions about comic books, and then concerns about films, radio serials, and television programs emerged. More recently, concern has been focused on the graphic violence in videogames. In each instance, there have been valid reasons for the concerns and various studies have shown some link between media violence and aggression. However, the recent debates have become particularly heated because the nature of the violence presented to children and youth has become especially graphic and pervasive in various media formats. This review provides a description of the evolving consensus on research findings as the nature and specificity of research strategies have evolved over the past century. The review ends with a discussion of findings from the most recent research which points to neurological evidence of changes leading to disruptions in processing video violence and changes in attitudes, values, and behavior. The resultant pattern of neurological processing leads to the production of what may be called “thoughtless vigilantes” who lack remorse and understanding of the effects of violence on others.

Viewing Video Violence

A 16-year-old male who was an “accomplished” player of the violent videogame, *Grand Theft Auto (GTA)*, carjacked an automobile from an elderly man, leaving him beaten and bloodied on the ground and drove recklessly down the highway. He was captured by police in a small town in Alabama and was taken to the police station for questioning and detainment. When one of the officers entered the interview room, the young man grabbed the officer’s gun and shot him. He then exited the interview room and shot another officer investigating the sound of gunfire. He next shot the police radio dispatcher in the adjoining office. Each killing was a “clean shot to the head” of the victims. He then exited the police station, stole a police patrol car, and drove quickly down the highway. He was later captured by a team of heavily-armed police from the surrounding towns. When questioned, more carefully this time, by police officers, he informed them that he had learned to shoot “head shots” – very difficult but very effective target shooting – by playing *GTA*. He also learned to effect his escape from the interview room by surprising the police officer and using his own gun to kill him from . . . you guessed it, playing *GTA*. (Tuscaloosa News, September 18, 2007).

Now, if this was just an isolated incident, one might be tempted to dismiss this as a tragic but unusual happening. Alas, this is not a unique event and variations on this theme have occurred in many parts of the United States and elsewhere in the world; wherever *Grand Theft Auto* or *Strike Force* or legions of other similar “shooter” games are to be found in the hands of young males. The adolescent years are the years before full brain development – such as that of the frontal lobes involving judgment and reasoning – have emerged in the youngster. In recent years, psychologists and neuroscientists have joined with communication studies professionals to examine several facets of brain and behavior in the context of exposure to video violence (Anderson et al., 2006).

We know a great deal about the behavioral and attitudinal changes associated with viewing violence. Indeed, there is a long history of research on this topic, dating from the 1950s through to the present. Much of this research was focused on the impact of violence on television (see, Murray, 1973; Pecora, Murray, & Wartella, 2007) and, more recently, studies of videogame violence (Vorderer & Bryant, 2006). The addition of studies of brain activation patterns while viewing video violence (see, Murray et al., 2006; Wang et al., 2009) provide insights into the ways in which viewers “process” violence and enhance our understanding of the nature of video violence effects. So, what do we know about the behavioral and neurological effects of viewing violence? Is there a basis for speculating that viewing video violence or participating in the entertainment violence of videogames can produce neurological patterns, stored images and behavioral-repertoire guides that might increase the likelihood of violent acting-out among youngsters? Might these actions become somewhat automatic by having this aggressive repertoire “triggered” by threats in

the social context; leading to “thoughtless vigilantes” who quickly respond to provocations with violence by leaning on the limbic system and other brain structures while bypassing the prefrontal cortex and rational decision-making that weighs the consequences of actions?

This chapter is designed to provide a review of the long history of research on behavioral effects of violence viewing and integrate the emerging evidence from neurological studies. We begin with the early research and concerns that set the stage for investigations of media violence.

Research and Social Concerns upon the Introduction of Television

The early studies of television’s influence began almost simultaneously in England, and the United States and Canada, in the mid-1950s. They were designed to take advantage of the regulated introduction of the new medium. Later studies – in the 1970s – would revisit these issues and this research strategy when television was being introduced into isolated communities in Australia (Murray & Kippax, 1978) and Canada (MacBeth, 1996; Williams, 1986).

In England, a group of researchers at the London School of Economics and Political Science, under the direction of Hilde Himmelweit, a reader in social psychology, began the first study of children’s television viewing patterns while TV was still relatively new (only three million TV sets were installed in the 15 million households in England). This study was proposed by the Audience Research Department of the British Broadcasting Corporation (BBC) but was conducted by independent researchers. The research, begun in 1955, was published in a 1958 report, *Television and the Child: An Empirical Study of the Effect of Television on the Young* (Himmelweit, Oppenheim, & Vince, 1958). The US and Canadian study was conducted by Wilbur Schramm and his colleagues in communications at Stanford University. This project began in 1957 was published in a 1961 report, *Television in the Lives of Our Children* (Schramm, Lyle, & Parker, 1961).

The British and US/Canadian surveys provided a very important benchmark for understanding the broad and general effects of television on children. For example, Himmelweit et al. noted: “We have found a number of instances where viewers and controls differed in their outlook; differences which did not exist before television came on the scene. There was a small but consistent influence of television on the way children thought generally about jobs, job values, success, and social surroundings” (pp. 17–18). With regard to aggression, these correlational studies did not support an association. Himmelweit and her colleagues noted: “We did not find that the viewers were any more aggressive or maladjusted than the controls; television is unlikely to cause aggressive behaviour, although it could precipitate it in those few

children who are emotionally disturbed. On the other hand, there was little support for the view that programmes of violence are beneficial; we found that they aroused aggression as often as they discharged it" (p. 20). The conclusions of Schramm, Lyle and Parker were something of a mantra:

For *some* children under *some* conditions *some* television is harmful. For *other* children under the same conditions, or for the same children under *other* conditions, it may be beneficial. For *most* children under *most* conditions, *most* television is probably neither particularly harmful nor particularly beneficial. (p. 1; original italics)

But their conclusions also included the observation that those Canadian and US children who had high exposure to television and low exposure to print were more aggressive than those with the reverse pattern. Thus, the early correlational studies or surveys identified some areas of concern about television violence and set the stage for more focused investigations.

First Experimental Studies

Moving beyond these 1950s surveys, there was another set of studies that emerged in the early 1960s – not surveys or correlational studies but experimental studies that were addressed to cause and effect relationships in the TV-violence/aggressive-behavior equation. These initial experiments were conducted by Albert Bandura, at Stanford University, who studied preschool age children, and Leonard Berkowitz, at the University of Wisconsin, who worked with college-age youth. In both instances, the studies were experimental in design, which meant that subjects were randomly assigned to various viewing experiences and therefore the results of this manipulated viewing could be used to address the issue of causal relationships between viewing and behavior. The early Bandura studies, such as *Transmission of Aggression through Imitation of Aggressive Models* (Bandura, Ross, & Ross, 1961) or *Imitation of Film-Mediated Aggressive Models* (Bandura, Ross, & Ross, 1963), were set within a social learning paradigm and were designed to identify the processes governing the ways that children learn by observing and imitating the behavior of others. In this context, therefore, the studies used stimulus films (videotape was not generally available) back projected on a simulated television screen, and the behavior of the children was observed and recorded in a playroom setting, immediately following the viewing period. Despite the structured nature of these studies, Bandura's research was central to the debate about the influence of media violence. Moreover, the work of Berkowitz and his colleagues, such as *Effects of Film Violence on Inhibitions Against Subsequent Aggression* (Berkowitz & Rawlings, 1963) or *Film Violence and the Cue Properties of Available Targets* (Berkowitz & Geen, 1966), studied the simulated aggressive behavior of youth and young adults following the viewing of segments of violent films, such as a Kirk Douglas boxing film, *The Champion*. The demonstration of increased will-

ingness to use aggression against others following viewing, further fueled the debate about the influence of media violence.

Concern about the influence of TV violence began as early as the start of this new medium. The first Congressional hearings were held in the early 1950s (United States Congress, 1952; 1955). At these early hearings, developmental psychologist Eleanor Maccoby (1954) and sociologist Paul Lazarsfeld (1955) presented testimony that relied upon some early studies of violence in films, such as the 1930s' report, *Boys, Movies and City Streets* (Cressey & Thrasher, 1933) to outline a necessary program of research on the issue of TV violence and its effects on children.

As the 1960s progressed, concern in the United States about violence in the streets and the assassinations of President John F. Kennedy, Martin Luther King, Jr., and Robert Kennedy stimulated continuing interest in media violence. In response, several major government commissions and scientific and professional review committees were established, from the late 1960s through the 1990s, to summarize the research evidence and public policy issues regarding the role of television violence in salving or savaging young viewers.

The Five Principal US Commissions

The five principal US commissions and review panels – National Commission on the Causes and Prevention of Violence (Baker & Ball, 1969); Surgeon General's Scientific Advisory Committee on Television and Social Behavior (1972; Murray, 1973); National Institute of Mental Health (1982) Television and Behavior Project; Group for the Advancement of Psychiatry (1982) Child and Television Drama Review; and the American Psychological Association Task Force on Television and Society (Huston et al., 1992) – have been central to setting the agenda for research and public discussion.

In 1982, the National Institute of Mental Health (NIMH) published a 10-year follow up of the 1972 Surgeon General's study. The two volume report (National Institute of Mental Health, 1982; Pearl, Bouthilet, & Lazar, 1982), collectively titled, *Television and Behavior: Ten Years of Scientific Progress and Implications for the Eighties*, provided a reminder of the breadth and depth of knowledge that had accumulated on the issue of TV violence. In this regard, the NIMH staff and consultants concluded:

After 10 more years of research, the consensus among most of the research community is that violence on television does lead to aggressive behavior by children and teenagers who watch the programs. This conclusion is based on laboratory experiments and on field studies. Not all children become aggressive, of course, but the correlations between violence and aggression are positive. In magnitude, television violence is as strongly correlated with aggressive behavior as any other behavioral variable that has been measured. (p. 10)

In 1986, the American Psychological Association (APA) empanelled a Task Force on Television and Society to review the research and professional concerns about the impact of television on children and adults. The nine psychologists assigned to this committee undertook reviews of relevant research, conducted interviews with television industry and public policy professionals, and discussed concerns with representatives of government regulatory agencies and public interest organizations. The final report, entitled *Big World, Small Screen: The Role of Television in American Society* (Huston et al., 1992), included the following observation about television violence:

US television has been violent for many years. Over the past 20 years, the rate of violence on prime time evening television has remained at about 5 to 6 incidents per hour, whereas the rate on children's Saturday morning programs is typically 20 to 25 acts per hour. There is clear evidence that television violence can cause aggressive behavior and can cultivate values favoring the use of aggression to resolve conflicts. (p. 136)

The extent of concern – both social and scientific – is demonstrated by the fact that over the past half-century, about 1,000 reports have been published on the issue of TV violence (Murray, 1980; Pecora, Murray, & Wartella, 2007). Of course, only a small percentage of these thousands of pages represent original studies or research reports, but there is an extensive body of research on the impact of TV violence. Nevertheless, the research history is best described in terms of the nature of the research approaches: Correlational and experimental, and their variants cross-lagged panel studies and field studies.

Correlational Research

The demonstration of a relationship between viewing and aggressive behavior is a logical precursor to studies of the causal role that TV violence may play in promoting aggressive behavior. In the typical correlational studies that followed the Himmelweit et al., and Schramm et al. studies, such as those conducted for the Surgeon General's research program (Dominick & Greenberg, 1972; McLeod, Atkin, & Chaffee, 1972a, 1972b; Robinson & Bachman, 1972), the researchers found consistent patterns of significant correlations between the number of hours of television viewed or the frequency of viewing violent programs and various measures of aggressive attitudes or behavior. Also, another study, Atkin, Greenberg, Korzeny and McDermott (1979) found that heavy TV-violence viewers were more likely to choose physical and verbal aggressive responses to solve hypothetical interpersonal conflict situations (i.e., 45% of the heavy violence viewers chose physical/verbal aggressive responses vs. 21% of the low violence viewers). Similarly, a further study in this genre (Walker & Morley, 1991) found that adolescents who reported enjoying

TV violence were more likely to hold attitudes and values favorable to behaving aggressively in conflict situations.

In another approach, a large database, the Cultural Indicators Project, has been used to explore the relationship between television portrayals and the viewer's fearful conception of the world. In a series of studies begun in the 1960s, George Gerbner and his colleagues at the University of Pennsylvania (Gerbner, 1970; Gerbner, Gross, Morgan, & Signorielli, 1994) have tracked public perceptions of society in relation to the respondent's extent of television viewing. Of relevance to the violence issue, these researchers have identified differences in the risk-of-victimization perceptions, described as the "mean world syndrome" effect, of light versus heavy viewers. The heavy viewers (usually, five or more hours per day) are much more fearful of the world around them than are light viewers (about two or fewer hours per day). When questioned about their perceptions of risk, heavy viewers are much more likely to overestimate (i.e., greater than the FBI crime reports for their locale would suggest) the chance that they will be the victim of crime in the ensuing six months, have taken greater precautions by changing the security of their homes or restricting their travels at night, and are generally more fearful of the world. As Gerbner et al. (1994) note:

We have found that long-term exposure to television, in which frequent violence is virtually inescapable, tends to cultivate the image of a relatively mean and dangerous world . . . in which greater protection is needed, most people cannot be trusted, *and most people are just looking out for themselves.* (p. 30, italics added)

Special-Case Correlational Research

Studies such as the early surveys clearly demonstrate that violence viewing and aggressive behavior are related but they do not address the issue of cause-and-effect. And yet, there are some special-case correlational studies in which "*intimations of causation*" can be derived from the fact that these studies were conducted over several time periods. There have been three major "panel" studies: A study funded by CBS (Belson, 1978), one funded by NBC (Milavsky, Kessler, Stipp, & Rubens, 1992), and the third funded by the Surgeon General's Committee and NIMH (Huesmann & Eron, 1986; Huesmann, Eron, Lefkowitz, & Walder, 1984; Lefkowitz, Eron, Walder, & Huesmann, 1972).

The CBS study (Belson, 1978) was conducted in England with 1,565 youths who were a representative sample of 13- to 17-year-old males living in London. The boys were interviewed concerning the extent of their exposure to a selection of violent television programs (broadcast during the period 1959 through 1971 and rated by members of the BBC viewing panel for level of violence) as well as each boy's level of violent behavior as determined by his report of how often he had been involved in any of 53 categories of violence over the previous six months. The degree

of seriousness of the acts reported by the boys ranged from only slightly violent aggravation, such as taunting, to more serious and very violent behavior such as: "I tried to force a girl to have sexual intercourse with me"; "I bashed a boy's head against a wall"; "I burned a boy on the chest with a cigarette while my mates held him down"; and "I threatened to kill my father." Approximately 50% of the 1,565 boys were not involved in any violent acts during the six-month period. However, of those who were involved in violence, 188 (12%) were involved in 10 or more acts during the six-month period. When Belson compared the behavior of boys who had higher exposure to televised violence to those who had lower exposure (and had been matched on a wide variety of possible contributing factors), he found that the high-violence viewers were more involved in serious interpersonal violence.

The NBC study (Milavsky, Kessler, Stipp, & Rubens, 1982) was conducted over a three-year period from May 1970 to December 1973 in two cities, Fort Worth and Minneapolis. Interviews were conducted with samples of second- to sixth-grade boys and girls and a special sample of teenage boys. In the elementary school sample, the information on television viewing and measures of aggression were collected in six time periods over the three years. The aggression measure consisted of peer ratings of aggressive behavior based on the work of Eron and his colleagues (Eron, Walder, & Lefkowitz, 1971). In the teenage sample there were five waves of interviews over the three years and the aggression measures were self-report rather than peer-reported aggression. In summarizing the results of this study, the authors concluded: "On the basis of the analyses we carried out to test for such a causal connection there is no evidence that television exposure has a consistently significant effect on subsequent aggressive behavior in the [elementary school] sample of boys." (Milavsky et al., 1982, p. 482). Similar null findings were reported for the elementary school girls and the teenage boys. However, re-analyses of these data by Kenny (1984) and Cook and his associates (Cook, Kendzierski, & Thomas, 1983) have concluded that there are small but clear causal effects in the NBC data and that these effects become stronger when analyzed over longer time periods through successive waves of interviews.

Finally, one of the longest panel studies, 22 years, is the work of Leonard Eron and his colleagues (Eron, 1963, 1982; Husemann & Eron, 1986; Huesmann, Eron, Lefkowitz & Walder, 1984; Lefkowitz, Eron, Walder & Huesmann, 1972). In the initial studies, conducted for the Surgeon General's investigation of TV violence (Lefkowitz et al., 1972), the researchers were able to document the long-term effects of violence viewing by studying children over a 10-year period from age 8 to age 18. At these two time periods, the youngsters were interviewed about their program preferences and information was collected from peer ratings of aggressive behavior. The violence levels of their preferred TV programs and other media and measures of aggression across these two time periods suggested the possibility that early television violence viewing was one factor in producing later aggressive behavior. In particular, the findings for 211 boys followed in this longitudinal study demonstrated that TV violence at age 8 was significantly related to aggression at age 8 ($r = .21$) and

the 8-year-old violent TV preferences were significantly related to aggression at age 18 ($r = .31$), but TV violence preferences at age 18 were not related to aggressive behavior at the earlier time period, age 8 ($r = .01$). When other possible variables, such as parenting practices and discipline style, were controlled, it was still clear that early media violence could be part of the cause of later aggressive behavior. Furthermore, in a follow-up study, when these young men were now age 30 (Huesmann et al., 1984), the authors found a significant correlation ($r = .41$) between TV violence levels at age 8 and serious interpersonal criminal behavior (e.g., assault, murder, child abuse, spouse abuse, rape) at age 30.

Behavioral to Neurological – Connections

Research conducted over the past 50 years leads to the conclusion that televised violence does affect viewers' attitudes, values, and behavior (Hearold, 1986; Murray, 1994; Paik & Comstock, 1994). In general, there seem to be three main classes of effects – aggression, desensitization, and fear:

- *Aggression:* Heightened levels of viewing televised violence can lead to increases in aggressive behavior and/or changes in attitudes and values favoring the use of aggression to solve conflicts;
- *Desensitization:* Extensive violence viewing may lead to decreased sensitivity to violence and a greater willingness to tolerate increasing levels of violence in society;
- *Fear:* Extensive exposure to television violence may produce the “mean world syndrome” in which viewers overestimate their risk of victimization.

Although the body of research on the effects of viewing television violence is extensive and fairly coherent in demonstrating systematic patterns of influence, we know surprisingly little about the processes involved in the production of these effects. Although we know that viewing televised violence can lead to increases in aggressive behavior or fearfulness and changed attitudes and values about the role of violence in society, it would be helpful to know more about how these changes occur in viewers.

To set the context for the continuing research – within the broad framework of a social learning paradigm – we know that changes in behavior and thoughts can result from observing models in the world around us, be they parents, peers, or other role models, such as those provided by mass media. The processes involved in “modeling” or imitation and vicarious learning of overt behavior were addressed in social learning theories in the 1960s (Bandura, 1962, 1969; Berkowitz, 1962, 1965) but we need to expand our understanding of the neurological processes that might govern the translation of the observed models into thoughts and actions.

As a start in this new direction, both Bandura (1994) and Berkowitz (1984) have provided some theoretical foundations for the translation of communication "events" into thoughts and actions. Bandura's "social-cognitive" approach and Berkowitz's outline of a "cognitive-neoassociation" analysis, posit a role for emotional arousal as an affective tag that may facilitate lasting influences. As Bandura (1994) notes: "People are easily aroused by the emotional expressions of others. Vicarious arousal operates mainly through an intervening self-arousal process. . . . That is, seeing others react emotionally to instigating conditions activates emotion-arousing thoughts and imagery in observers." (p. 75). With regard to aggression, we know that viewing television violence can be emotionally arousing (e.g., Cline, Croft, & Courrier, 1973; Osborn & Endsley, 1971; Zillmann, 1971, 1982) but we lack direct measures of cortical arousal or activation patterns in relation to violence viewing.

The pursuit of neurological patterns of cortical arousal in violence viewing would likely start with the amygdala because it has a well-established role in the control of physiological responses to emotionally arousing or threatening stimuli (Damasio, 1994, 1999; Kosslyn & Koenig, 1995; LeDoux, 1996; LeDoux & Hirst, 1986; Ornstein, 1997; Panksepp, 1998; Steward, 2000). Indeed, a recent National Research Council (1993) report from the Panel on the Understanding and Control of Violent Behavior, concludes:

All human behavior, including aggression and violence, is the outcome of complex processes in the brain. Violent behaviors may result from relatively permanent conditions or from temporary states. [...] Biological research on aggressive and violent behavior has given particular attention to the following in recent years: [...] (2) functioning of steroid hormones such as testosterone and glucocorticoids, especially their action on steroid receptors in the brain; [...] (6) neurophysiological (i.e., brain wave) abnormalities, particularly in the temporal lobe of the brain; (7) brain dysfunctions that interfere with language processing or cognition. (pp. 115–116)

Thus, one suggestion for further research on the impact of media violence is to assess some of the neurological correlates of viewing televised violence. In particular, the use of videotape of violent scenes can serve as the ideal stimulus for assessing activation patterns in response to violence. These neurobiological studies hold the key to understanding the ways in which children might respond to seeing violence in entertainment and this might also be the key to thinking about the desensitization to violence, or what some might describe as a "drugging" effect on the developing child. To assess this possibility, we embarked on an initial study of children's brain activations while the youngsters viewed violent and non-violent video program material. We reasoned that there may be similarities between the ways humans respond to the threats of physical violence in the real world and the neurobiological response to so-called "entertainment" violence.

Beginnings of Brainmapping

We can begin our quest with some notions and expectations drawn from previous research suggesting that we might find the “threat recognition” system – involving the limbic system and right hemisphere of the brain – as an area that will be activated while viewing video violence. The development of hypotheses about violence viewing and brain activation, however, needs to start with research on physiological arousal (e.g., Osborn & Endsley, 1971; Zillmann, 1982; Zillmann & Bryant, 1994) and link this to cortical arousal (Davidson & Tomarken, 1989; Davidson, Ekman, Saron, Senulis, & Friesen, 1990; Ekman & Davidson, 1993, 1994; Ekman, Davidson, & Friesen, 1990).

In our pilot study (Murray et al., 2006), we found that both violent and nonviolent viewing activated regions implicated in aspects of visual and auditory processing. In contrast, however, viewing TV violence selectively recruited right precuneus, right posterior cingulate, right amygdala, bilateral hippocampus and parahippocampus, bilateral pulvinar, right inferior parietal and prefrontal, and right premotor cortex. Thus, TV violence viewing appears to activate brain areas involved in arousal/attention, detection of threat, episodic memory encoding and retrieval, and motor programming. These areas are important because they are likely indicators of the perception of threat and possible long-term memory storage of the threat-event (particularly, these patterns are similar to the memory storage of traumatic events by PTSD patients. These activation patterns demonstrate that video violence viewing selectively activates right hemisphere, and some bilateral areas, that collectively suggest significant emotional processing of video violence.

Our continuing research at Harvard Medical School, Children’s Hospital Boston is designed to address these questions about violence viewing in a more robust study that employs a larger and more differentiated sample of children who have had differing experiences with violence (e.g., children who are identified as high or low in aggressive tendencies and children who have been victims of abuse). We will continue to use the methods and procedures that were demonstrated to be effective in the pilot study – we will conjoin measures of physiological arousal (e.g., GSR, heart rate) with neuroimaging techniques (e.g., functional Magnetic Resonance Imaging – fMRI) to track the emotional and neurological processes involved in viewing televised violence. We anticipate finding clear differences in the three groups of children, with the victims of violence – the abused youngsters – being most responsive to viewing media violence and the aggressive youngsters being the least responsive to the entertainment violence; this is the desensitization effect that results from extensive violence viewing and acting out the violence witnessed in the entertainment world of film, television, and videogame violence. In the past five or six years, there has been a great expansion in research interest in the connection of behavioral and neurological patterns related to video violence viewing. In particular, interest

has focused on the role of the prefrontal cortex in mediating or moderating the violence viewing and aggression relationships. Several recent papers have provided new insights on this fascinating area of research.

Exploring the Prefrontal Cortex

The most ambitious program of research in this area is the work of a group at the University of Indiana Medical School (e.g., Kronenberger et al., 2005a; Mathews et al., 2005; Wang et al., 2009). In their early research, the team focused on the issue of frontal lobe activation in aggressive and non-aggressive adolescents while viewing video violence in an MRI.

In one of the early studies (Kronenberger et al., 2005b), the Indiana team examined the relationship between media violence exposure in television and videogames in aggressive versus non-aggressive adolescents. They interviewed 27 adolescents (13–17 years) diagnosed as having Disruptive Behavior Disorders (DBD) with Aggressive Features and 27 controls who were matched for age, gender, and IQ, concerning their exposure to violence on television and videogames. The results indicated that the DBD-aggressive youngsters had higher aggregate media violence exposure, higher exposure to videogame violence, and higher parent-reported exposure to television violence than their matched controls. Indeed, exposure to television violence tended to be accompanied by exposure to videogame violence. Moreover, the relation between media violence and DBD was not due to the spurious effects of gender or IQ.

This initial finding encouraged the team to pursue the possible links between brain activation patterns while watching video violence. In the next study (Mathews et al., 2005), the team used functional magnetic resonance imaging (fMRI) to explore frontal lobe activation in aggressive and non-aggressive adolescents. In an initial visit, subjects were given diagnostic assessments and media violence interviews. Aggressive adolescents (28 with Disruptive Behavior Disorder with aggressive features) and non-aggressive control adolescents (43) were given a semi-structured interview concerning media violence exposure and a media violence exposure index (MEVI) was constructed for each adolescent. In the second visit, the adolescents were presented with an executive functioning task (the Counting Stroop, or CS task) while in the MRI scanner of the aggressive DBD students, 19 successfully completed the CS task at 70% or better accuracy. These 19 DBD adolescents were matched (on age, gender, and IQ) with 19 controls who had also completed the CS task successfully. Analysis of the fMRI scans showed differences in executive processing patterns in the DBD adolescents when compared to the controls. The main area of interest was the dorsolateral prefrontal cortex (DLPFC), the anterior cingulate cortex (ACC), inferior frontal gyrus (IFG), and the middle frontal gyrus (MFG). The results demonstrated sharp differences between the aggressive teens and the controls – the entire control group showed significant activation of the ACC, left MFG, and Left IFG, while the

aggressive teens showed activation only in the MFG, bilaterally. The main conclusion in this analysis is the fact that frontal lobe activation is reduced in aggressive (DBD) teens and this is reinforced by the finding that even in the control subjects, those with high media violence exposure demonstrated similarly reduced prefrontal activation, rather like the aggressive teens. Thus, the authors conclude that high media violence exposure alters brain activation patterns in both aggressive and control subjects and is responsible for reduced prefrontal control and executive function processing.

As a follow-on to these findings, the Indiana team (Wang et al., 2009), conducted a study that even a short-term exposure to a violent videogame changes both the frontal cortex and limbic system functioning in adolescents. In this case, the adolescents played a violent or nonviolent videogame within 10 minutes prior to an fMRI scan that involved measures of executive functioning (the Counting Stroop task). The adolescents (13–17 years) were screened for any history of neurologic or psychiatric disorders and 44 youngsters were selected on the basis of absence of pathology. The random assignment to two groups of 22 teens assigned to play either a violent videogame (*Medal of Honor*) or a nonviolent videogame (*Need for Speed*) demonstrated that the groups did not differ on age, IQ, or gender. All youngsters were interviewed about their media violence exposure (MEM) and were given 30-minutes training in learning and practicing to play whichever game was assigned. On the following visit, the youngsters played their assigned game for 30 minutes, immediately (within 10 minutes) to the fMRI scans. The subjects were given two tasks in the MRI, the traditional Counting Stroop task, a measure of executive functioning and attentional control, and the Emotional Stroop task involving emotion-laden violent and nonviolent words which are likely to activate the limbic system, particularly the amygdala. The results demonstrated that the youngsters who played the violent videogame (*Medal of Honor*) showed more activity in the amygdala (right) and less activation in the medial prefrontal cortex (MFPC) while the teens who played the nonviolent game (*Need for Speed*) demonstrated activations of the prefrontal cortex, the anterior cingulate cortex, and the dorsolateral prefrontal cortex. Indeed, there was a distinct uncoupling of activation with the amygdala in the nonviolent videogame group. Thus, the study demonstrates that even short-term involvement with violent videogame playing can significantly alter neural circuitry in the execution of cognitive and emotional tasks during fMRI scans.

Other researchers, Kelly and Grinband (2007) have shown that repeated exposure to media violence is associated with diminished response in the frontolimbic network. In particular, repeated exposure to violent media (but not exposure to other active but nonviolent media) results in reduced right lateral orbitofrontal cortex (lOFC) and a decreased interaction with the amygdala. Thus, violent media can result in diminished responsiveness to a brain network that is associated with behavioral reactive aggression.

So, what have we learned about neurological and behavioral correlations in relation to media violence? Clearly, we are in the beginning stages of this line of inquiry,

but we begin to see the patterns of potential influence. It is possible that repeated exposure to media violence may lead to changes in both the prefrontal cortex and limbic system interactions that may disrupt the processing of aggressive, emotion-laden information. The result may be an increase in aggressive behavior and/or the triggering of excessive aggression in response to provocations. The fact that aggressive and emotional arousing perceptions seem to be stored in the posterior cingulate gives rise to the possibility that these aggressive action patterns might become the instant-recall of a guide for social behavior. Hence, the possibility of the production of “thoughtless vigilantes.” Clearly, we need to be more “thoughtful” about our studies of media violence, aggression, and the neuro-cognitive processing of our daily experiences.

Gender-Role Socialization in the Twenty-First Century

Nancy Signorielli

ABSTRACT

Gender-role socialization has been a critical element in the study of mass communication since the late 1960s. This chapter will review our knowledge of this topic looking specifically at gender-role images on television, including broadcast programs and commercials, children's TV, and teen movies. The chapter focuses specifically on research conducted during the first decade of the twenty-first century examining images related to age, race, and occupation. A critical and key finding is that women continue to be underrepresented in most venues. The chapter also discusses the influence of these gender-role media images on people's conceptions about being men and women, particularly the continued relationship between viewing and expressing more stereotypical conceptions about gender roles.

Television and Gender

Gender-role socialization has been a critical element in the study of mass communication since the late 1960s. Most of the research and attention on the socialization of gender roles have focused on television as one of the most important agents of socialization in today's society. This chapter will focus specifically on television's

gender roles, looking at what we know about these messages at the start of the second decade of the twenty-first century and what we know about how these messages and images may influence conceptions about being men and women.

As we progress in the twenty-first century, although we spend more and more time with “screens,” the screen we watch most is television (Blair, 2009). Television has become an “on demand” medium. We can purchase whole seasons of favorite programs and can call up movies and programs whenever, and to some extent wherever (using computer, phones, etc.) we want.

Nielsen (2009) reports that the amount of time spent viewing has been rising for the past few years. At the end of 2008 the average person watched TV in her/his home for about five hours a day. In addition, the most recent report of the Kaiser Family Foundation found that children’s media use averaged more than seven and a half hours a day that expanded to almost 11 hours a day when multitasking was taken into account (Rideout, Foehr, & Roberts, 2010).

Television’s role for the past 60 years as the central and most pervasive mass medium in US culture has not changed. Television still plays a distinctive and historically unprecedented role as the nation’s most common, constant, and vivid learning environment. Television, whether we watch on a traditional set, on our mobile phone or on the Internet is still our primary storyteller, telling most of the stories to most of the people, most of the time (Chapter 2, this volume). These stories, however, are the product of a few multinational and centralized commercial institutions. Television’s stories show and tell us about life – its people, places, power, and fate – as well as how things work and how to solve problems. Characterizations represent the good and bad, the happy and sad, successes and failures, and they show who’s on the top and who’s on the bottom of the economic ladder and/or pecking order.

This chapter will examine the portrayals of men and women in the media paying most attention to prime-time broadcast television programming as this is where the lion’s share of the research has been conducted. These portrayals will look at the intersection of gender roles in relation to age, race, and occupations. It will focus, as much as possible, on research that has been conducted and published during the first decade of the twenty-first century. In addition, the review will present data from the author’s ongoing yearly content analyses of prime-time network programming broadcast in the fall of each year. This data set, collected between 2000 and 2009, consists of 783 programs and 3,268 major or leading characters. The methods used in this ongoing research can be reviewed in several recent publications (see, for example, Signorielli & Bacue, 1999).

Theoretical Orientations

Socialization is the way people learn about their culture and acquire its values, beliefs, perspectives, and social norms. It is an ongoing social process; we are socialized and

resocialized throughout the life cycle. Traditionally, parents, peers, teachers, and the clergy have had the major responsibility for socialization. Numerous studies have found, however, that the mass media play a very important role in the socialization process (Berry & Mitchell-Kerman, 1982). Stereotypes, in particular, are important in television's role as an agent of socialization (Chapter 13, this volume). Stereotypes are conventional or standardized images or conceptions; they are generalizations or assumptions often based on misconceptions. Stereotypes lack originality; they fall back upon commonly known and often one-dimensional elements of portrayal. They appeal to people's emotions rather than intellect. Television programs with limited time to devote to character development often resort to stereotypes in the storytelling process. The concern is that viewers, especially children, continually exposed to television's stereotyped roles, may develop conceptions and perceptions about people that reflect the stereotypical images they see in the media.

The actual processes of media socialization, however, are different from those used by more traditional agents of socialization and may involve observational and/or social learning. Social or observational learning theory examines the role of modeling in a child's social development. It posits that viewers, especially children, imitate the behavior of television characters in much the same way they learn social and cognitive skills by imitating their parents, siblings, and peers (Lefkowitz & Huesmann, 1980). Bandura's (2009) extension of cognitive processing to social learning theory (social cognitive theory) added rules and strategies (the "how to") to the traditional why, what, and when of behavior change.

Bandura (2009) notes that this perspective is based on four subfunctions or processes: attention, retention, production, and motivation. Viewers must pay attention to the models; those who are more attractive or more salient may be more important. Attention, however, must be followed by retention: we cannot be influenced by models unless we remember what we have seen. Moreover, repeated exposure to the same images and/or models facilitates remembering. The third process, production, necessitates that viewers incorporate these images into their own behaviors. Finally, viewers must be motivated to incorporate these behaviors. Seeing media characters rewarded (or punished) when they behave in either traditional or nontraditional ways may facilitate learning specific sex-typed behaviors (Smith & Granados, 2009). Overall, television's stereotypes are particularly suited to the processes of social learning/social cognitive theory because they provide simplistic, often one-dimensional models of behaviors, strategies, and rules that appear regularly in many different genres of programs.

A second theoretical orientation relevant to the media's role as an agent of socialization is cultivation theory (Morgan, Shanahan, & Signorielli, 2009; Chapter 2, this volume). This theory explores the general hypothesis that the more time viewers spend with television the more likely their conceptions about the world and its people will reflect what they see on television. Thus, television must be studied as a collective symbolic environment of messages with an underlying pattern or formulaic structure. Due to commercial constraints, television presents a common world view

and common stereotypes through a relatively restrictive set of images and messages that cut across all programs in all delivery systems. The term cultivation refers to “the specific independent (though not isolated) contribution that a particular consistent and compelling symbolic stream makes to the complex process of socialization and enculturation” (Gerbner, 1990, p. 249).

Gender-Role Images

The most consistent and pervasive gender-role image on television is the underrepresentation of women. Beginning in the 1950s (Head, 1954) and through the 1970s men outnumbered women by three to one on broadcast network television (Signorielli, 1985). Women’s representation began to increase during the mid-1980s. By the end of the 1980s the male-female distribution was roughly two-thirds male and one-third female and by the end of the twentieth century the distribution was about 60% male and 40% female (Signorielli & Bacue, 1999). The underrepresentation of women in prime-time network broadcast programs has remained steady during the first decade of the twenty-first century. Data from the author’s ongoing research of yearly samples of prime-time broadcast network programming (situation comedies, dramas, action programs, and reality programs) show that yearly male-female distributions in the past 10 years have not veered from a 58% male ($F = .8446$, $df = 1,9$, ns) to 42% female ($F = .7340$, $df = 1,9$, ns) distribution. Consequently, although the distribution of men and women in prime-time network programs is more equal today, it does not come close to parity with the US population (51% female and 49% male).

Portrayals and Behind the Scenes Personnel

An interesting line of research shows that the distribution of males and females in prime-time programs is related to the gender makeup of those who create the programs – the writers, directors, producers, and other behind the scenes personnel. Lauzen and Dozier (1999) found that male characters outnumbered female characters and that men were three-quarters and women one-quarter of the behind the scenes personnel. The women, however, had fewer prestigious positions; they were the assistant directors or associate producers compared to the men who were producers or directors. Interestingly, there were more female characters when women were in more powerful behind the scenes positions (executive producers and producers).

The sex distribution of behind the scenes personnel is related to other aspects of male-female portrayals in prime-time programs. Female characters in programs with women executive producers were more verbal (spoke, interrupted, used more powerful language, and had the last word in a discussion or argument) than female characters in programs with male executive producers (Lauzen, Dozier, & Hicks, 2001). In addition, when women were behind the scenes, characters exhibited more

equitable on-screen portrayals by reducing the number of males in leadership roles rather than increasing the number of female characters (Lauzen, Dozier, & Bradley, 2004). Interestingly, when women were the writers or creators, both male and female characters appeared in interpersonal (home, family, romance) roles; when men were the writers and creators, both male and female characters were often seen in work-related roles (Lauzen, Dozier, & Horan, 2008). Finally, Lauzen and Deiss (2009) found that female characters spoke directly to the camera (broke the fourth wall) more often when women were behind the scenes.

Minorities and Gender

In the 1970s and 1980s, studies found that the numbers of Blacks on television began to reflect their proportion in the US population (Greenberg, 1980). Recent analyses show an even greater degree of parity. At the end of the twentieth century in broadcast prime-time network programs, Blacks reached a level of representation that accurately reflected their numbers in the US population but other minorities were practically invisible (Hunt, 2002; Mastro & Greenberg, 2000; Chapter 13, this volume).

The racial composition of prime time's leading characters is very much tied to program genre. Since the mid-1990s, Blacks achieved parity with their numbers in the US population because they were most often found in situation comedies that featured all-Black casts, and until 2006, on the WB network. However, when the WB and the UPN networks merged to form the CW television network in 2006, the all-Black sitcoms almost ceased to exist. Thus, given the continued ongoing demise of the situation comedy during the first decade of the twenty-first century, Blacks may lose ground in television representation.

A critical element in the representation of minority groups is gender representation. Minority women are consistently underrepresented in prime time (Elasmar, Hasegawa, & Brain, 1999). Similarly, Hunt (2002) found the distribution of Black men and women was similar to the distribution of White men and women – 60% male and 40% female. Signorielli (2009a) found similar distributions by both race and gender; Whites and Blacks had a 58% male and 42% female distribution while the distribution for other people of color (Asians, Native Americans, etc.) was 55% male and 45% female. In another analysis of this data set, Signorielli (2009b) found that more racially diverse programs were more likely to underrepresent women while segregated programs (all/mostly White characters or mostly minority characters) had a more gender equitable distribution of characters.

Age

Study after study shows that the world of prime-time network broadcast television overrepresents young adult and middle-aged characters while underrepresenting children, adolescents, and the elderly and that women are cast as younger than men.

Signorielli (2004) found fewer than one in ten male and female characters were youngsters while elderly characters appeared even less frequently. Young adults and middle-aged characters, by comparison, appeared most frequently. Interestingly, more females than males were classified as young adults while more males than females were portrayed as middle-aged.

Character portrayals in the first decade of the twenty-first century show little change from previous analyses. The author's ongoing research shows that children, adolescents and the elderly continue to be underrepresented while young adults and middle-aged characters are overrepresented. Female characters are still more likely than the males to be cast as young adults (40% of the females compared to 32% of the males) while males are still more likely to be cast as middle-aged (59% of the males compared to 51% of the females). Thus, television programs at the end of the first decade of the twenty-first century are still populated by those age groups advertisers most wish to reach – young adults and the middle-aged.

Occupations

Until the end of the 1980s and the middle of the 1990s, television consistently stereotyped the way male and female characters were cast in occupations. Male characters were often seen in “male” jobs (doctors, lawyers, politicians) and females in “female” jobs (nurses, secretaries, and household workers) (Elasmar et al., 1999).

Signorielli and Kahlenberg (2001) found that the world of work on television is determined by dramatic rather than educational considerations. Television programs revolve around those jobs that help tell a good story. The work of doctors, lawyers, police, and forensic specialists is more interesting and exciting than the everyday work of laborers and bus or truck drivers. Overall, fewer women than men were categorized as having an occupation – only six out of ten females compared to three-quarters of the male characters. But women were not always cast in traditional female jobs. By the end of the twentieth century, women were just as likely as men to be cast as professionals (doctors, lawyers, teachers, etc.) and in white-collar (managers, clerical) jobs. Race and gender were also intertwined in occupational portrayals. Specifically, women of color were more likely than White women to be cast in blue-collar (service) jobs or in law enforcement.

Racially segregated (all/mostly White or mostly minority characters) and racially diverse (integrated) programs also differed in the types of occupations and levels of occupational prestige of the characters (Signorielli, 2009b). Women in racially segregated programs were not often depicted as having an occupation. Only four out of ten Black women in mostly minority programs were seen working outside the home and of those who were seen working, few were cast as professionals. Similarly, White women in all or mostly White programs were less likely to have prestigious jobs. Overall, the jobs of women in segregated programs, whether programs had mostly minority characters or mostly White characters, were the least diverse and the least

prestigious. Men's jobs, on the other hand, had little to do with whether the men were cast in segregated or integrated programs.

Since the turn of the century, the author's ongoing analysis shows that fewer women than men are still seen as having a specific job: three quarters of the men but only six out of ten women are portrayed in an occupation. At the same time, only one in five women is cast in a traditionally female job while about one-third have traditional male jobs and another third have gender-neutral jobs. Half of the males, on the other hand, have traditional male jobs and one in three has a gender-neutral job. Less than 5% of the male characters have traditionally female jobs. Women are as likely as men to be cast as professionals but while one in five men is cast in law enforcement related jobs, only one in ten of the women is so employed. Finally, television continues to overrepresent glamorous and more exciting jobs – doctors, lawyers, police, crime-scene investigators. The more mundane jobs, in which most people spend their work life, are rarely found. Moreover, television does not present work or occupations very realistically because while we know that characters have jobs, we rarely see them actually working. Interestingly, recent and very popular crime-scene programs (*CSI*; *Law and Order*) present these jobs as more glamorous and exciting than they actually are; the day-to-day, but important tasks, are often overlooked (Houck, 2006). Overall, content studies show that work, on television, typically appears to be easy and exciting and characters are almost always successful.

Gender Images in Children's Programs

As children spend so much time with television it is necessary to understand the nature of the images in these programs. Children's animated cartoons have traditionally been very sex-typed. Thompson and Zerbinos (1995) found considerable stereotyping consistent with traditional gender roles. There were more male than female characters, both in lead and supporting or minor roles. Male characters spoke more often than female characters. There were, however, some time-related differences. Cartoons produced after 1980 had more female characters than cartoons produced prior to 1980. Moreover, females in the post-1980 cartoons were more independent, intelligent, and competent than females in pre-1980 cartoons. There were also differences by cartoon type. The fewest female lead characters were found in chase-and pratfall cartoons (*Tom and Jerry*), followed by continuing adventure cartoons (*Teenage Mutant Ninja Turtles*), and "teachy-preachy" cartoons (*Smurfs*).

Cartoons broadcast in 2000 continue to be stereotyped. Leaper, Breed, Hoffman, and Perlman (2002) found that male characters outnumbered female characters by four to one in traditional adventure cartoons (*Spiderman*), two to one in comedy cartoons (*Animaniacs*), and 1.5 to one in educational/family cartoons (*Where in the World is Carmen Sandiego?*, *The Magic School Bus*). There was, however, an almost equal representation of males and females in nontraditional adventure cartoons (*Sailor*

Moon, *Gargoyles*). At the same time, males showed more physical aggression, particularly in the traditional adventure cartoons, than the females. Overall, females were more fearful, more supportive, more polite, and more interested in romance. Finally, males outnumbered females in all types of children's cartoons particularly adventures (*Teenage Mutant Ninja Turtles*), except those geared toward teens (*Hannah Montana*, *That's so Raven*) (Signorielli, 2008).

Superheroes are particularly stereotyped. Baker and Raney (2007) found that two-thirds of the superheroes were very muscular males and one-third were average-sized females. Female superheroes were more emotional, attractive, concerned about their personal appearance and asked questions while the male superheroes were more likely to exhibit angry behaviors. Although all of the superheroes were physically aggressive and powerful, female superheroes were more stereotyped because they often worked under a mentor while the male superheroes had positions of leadership and operated independently.

The Children's Television Act of 1990 mandated that stations must air three hours of educational and informational (E/I) programming each week (Chapter 34). Barner's (1999) analysis of E/I programs with social interaction as an important plot element (e.g., *Sweet Valley High*, *Bobby's World*, *Ghostwriter*), found that a majority of the programs had males as central characters and included a boy's name in the title. On the other hand, no programs had a female in the central role or a girl's name in the program's title. Males outnumbered females 59% to 41% among foreground characters, percentages that mirror the male-female distribution in prime-time programs. Males also did more than females: males exhibited 2.1 behaviors, often gender-stereotyped, per scene compared to 1.5 behaviors per scene for females. Males made and carried out plans and sought attention, were more aggressive, dominant, and active; behaviors that elicited consequences. Female behaviors, on the other hand, were deferential, nurturing, and dependent; behaviors that typically do not result in consequences to the character.

Movies and Music Videos

Movies have consistently underrepresented female characters and perpetuated gender stereotypes. Lauzen and Dozier's (2005) analysis of the top films of 2002 found a male-female distribution of three-quarters male to one-quarter female. Men in movies are typically cast as older (in their 30s and 40s) than the women (usually in their 20s and 30s). Moreover, males, particularly those more than 40, were often seen in powerful and leadership roles while older women were largely invisible. Finally, older female characters were very negatively stereotyped and perceived as less attractive, less friendly, and less intelligent (Bazzini, McIntosh, Smith, Cook, & Harris, 1997).

The top teen movies distributed between 1995 and 2005 (e.g., *Clueless*, *Mean Girls*, *She's All That*, *Freaky Friday*) had more female than male characters – 55% female to

45% male. Interestingly, there were few if any adult characters; 99% of the characters were high school or college students (Behm-Morawitz & Mastro, 2008). Although socially cooperative behaviors appeared more often than socially aggressive behaviors and were not gender-related, female characters were significantly more likely than male characters to engage in socially aggressive behaviors (e.g., illustrating the mean girl) that were typically not punished and often rewarded.

Disney movies, a staple of children's viewing repertoire, are quite gender stereotyped. From the earliest movies, (e.g., *Snow White*), to more recent films focusing on heroines (e.g., *Pocahontas*, *Beauty and the Beast*, *The Little Mermaid*), studies consistently show the films rely upon gender stereotypes in telling the story (Wiersma, 2001). Dundes (2001) notes that one modern Disney heroine, *Pocahontas*, is defined both by her romantic relationship and her nurturing role. Similarly, Ariel in *The Little Mermaid*, shows both her romanticism and her willingness to embrace life as a human in order to marry the prince. Beres (1999), a clinician whose practice has largely focused upon providing counseling to women involved in abusive spousal relationships, notes that movies, such as *Beauty and the Beast*, tend to romanticize men's controlling relationships with women as well as perpetuate gender stereotypes. Finally, Tanner, Haddock, Zimmerman, and Lund (2003) note that Disney films typically stereotype male-female relationships by presenting couples (mothers and fathers, for example) in traditional gender stereotypes.

Music videos, particularly rap videos, continue to present differences in gender portrayals with men overrepresented and portrayed more positively than women (Conrad, Dixon, & Zhang, 2009). Women were likely to be dressed provocatively, objectified, placed in positions of submission and often found in videos with controversial themes (misogyny and materialism). Males, on the other hand, were in videos with both controversial and community-oriented themes (e.g., community unity, political awareness).

Images in Commercials

Research has consistently shown that television commercials are very gender stereotyped, with males outnumbering females in all but commercials for beauty, health-related, or household domestic products (Ganahl, Prinsen, & Netzley, 2003). Stern and Mastro (2004), for example, found more males than females in commercials and that females were most underrepresented as children and in middle age and least underrepresented as teenagers. Young adult females were the most attractive and very thin, while older women were less attractive and heavier. Analyses also found that traditional female roles were closely related to age: girls and older women were seen in relation to home and family, while young women were seen in the work-world and doing other activities outside the home. Coltrane and Messineo (2000) found the racial groups that appeared least often (Latinos and Asians) had the highest proportion of female characters but they were presented as children. In general

White men were presented as powerful, African American men as aggressive, White women as sex-objects, and African American women barely existed. Blacks appeared more frequently on commercials aired on BET and were portrayed with more respect (Messineo, 2008). Although Black women were seen more often and as sexually desirable on BET, the images were more gender stereotyped and demeaning. Finally, voiceovers were predominantly male.

A study of national commercials, portraying domestic chores in prime-time network broadcast programming, found that almost two-thirds of those seen doing domestic chores were women, typically mothers, who performed childcare related activities, cooked, or cleaned (Scharrer, Kim, Lin, & Liu, 2006). Most women were not employed outside the home. Men's performance of domestic chores, however, was often presented humorously sending the message that men are not really capable of helping around the house. Overall, most of the chores were stereotyped in terms of who did them; consequently, portrayals of both men and women were traditional rather than nontraditional or counter-stereotypical.

Commercials in children's cartoons are also very gender stereotyped (Browne, 1998). Boys were more likely to show how to use the product, even when the products were gender-neutral. Adult women and men were seen in very gender-typed roles with the women as homemakers and the men working outside the home. Interestingly, a study of images on cereal boxes (Black, Marola, Littman, Chrisler, & Neace, 2009) found evidence of considerable gender-role typing. Males outnumbered females by two to one and were more often portrayed as animals (e.g., Tony the Tiger) or adults while females were children or adolescents.

We thus find at the end of the first decade of the twenty-first century that television images have not undergone many changes in terms of gender-role stereotypes. Women remain underrepresented, are younger than men, and race is often related to representation. While television does have some positive occupational portrayals for women, other media (e.g., videos, commercials, and cartoons), typically fall back on very traditional stereotypes.

Effects of Media Images

The description of television images is an important and necessary first step in understanding the role of television in society. Clearly, one cannot assess effects without knowing what people see. The rest of this chapter will discuss the effects of gender-role stereotypes, focusing, as much as possible, on studies conducted in the last 15 years. This chapter will focus only on research related to the possible effects of gender-role images. For more information about related topics the reader is referred to Chapter 13 for a discussion of racial and ethnic stereotypes, Chapter 15 for issues related to body image, and Chapter 19 for more information about sexual portrayals. This chapter will focus on how gender-role images influence children's perception

of, identification with, and cultivation of conceptions about the roles of men and women in society.

Perception of Gender-Role Images

Viewers, particularly children, are aware of and expect to find stereotyped images on television (Reeves & Greenberg, 1977). Thompson and Zerbinos (1997), for example, found that children perceived stereotyping in cartoons – boys were active and violent while girls were concerned with appearances and were found in domestic settings. Children, as young as kindergarten age, are aware of television's gender stereotypes and are able to predict whether men or women, boys or girls, would be found in different activities on television (Durkin & Nugent, 1998). More recently, however, Ogletree, Mason, Grahmann, and Raffeld (2001), looking at two cartoons produced during the late 1990s, found that elementary school children perceived the cartoon *Powerpuff Girls* as more aggressive than *Johnny Bravo*. Although the *Powerpuff Girls* themselves were seen as more androgynous, they did giggle often and sometimes resorted to typically stereotypical female behaviors (e.g., kisses) to achieve their goals.

Identification

Identification with characters in the media is influenced by gender-role stereotypes, particularly those on television. Children identify with television characters. As was true in the 1960s and 1970s (e.g., Reeves & Greenberg, 1977), boys are still more likely to name only a male as their favorite character while girls are equally likely to name both males and females as favorite characters. Hoffner (1996) extended this effect to what she calls wishful identification – wanting to be like characters, particularly those characters perceived as successful or attractive. This line of research finds that girls select as favorites female characters when they are physically attractive and select male characters when they intelligent and/or exhibit typical masculine traits such as physical strength. Hoffner's interviews with 7- to 12-year-old children show that wishful identification is more pronounced with same-sex characters and more pronounced for boys than girls. Interestingly, girls who choose males as favorite characters see them as "pseudo friends" rather than role models and perceive them as intelligent. At the same time, the girls show more parasocial interaction with same sex favorite characters, selected because they are attractive.

Aubrey and Harrison's (2004) study of first and second grade children found that the boys who preferred stereotyped content and male cartoon characters said they valued the traits of humor and hard work. Girls, who indicated they preferred male characters (in both stereotyped or counter-stereotyped roles) did not identify with or were not attracted to female characters. On the other hand, those girls who said

they preferred female characters cast in gender-neutral roles were attracted to and identified with female characters.

Identification continues into young adulthood. Undergraduates who watched more teen movies (e.g., *Mean Girls*, *10 Things I Hate about You*) expressed greater identification with the characters in these movies (Behm-Morawitz & Mastro, 2008). Moreover, college women who said they identified with female action heroes (e.g., *Buffy the Vampire Slayer*) believed that they had traits, such as confidence and assertiveness, in common with these female action heroes. These women also perceived that female action heroes were smart, confident, powerful, and attractive (Greenwood, 2007). In addition, Hoffner, Levine and Toohey (2008) found that while male college freshmen's favorite characters were males, only half of the freshmen women chose a female television character as their favorite. These students said that they liked characters portrayed with good paying and higher status jobs and did not particularly identify with characters whose jobs required a higher level of intelligence or skill.

Identification with television characters and their roles is but one way in which sex-role stereotypes and imagery may affect viewers, particularly children. Moreover, even though viewers, particularly children, realize that television characters are often gender stereotyped and may identify with them, another important question is how these stereotypes influence their attitudes and behaviors; that is, the cultivation of attitudes and conceptions about sex roles. The general and simplest hypothesis of cultivation theory and analysis is that those who spend more time with media, particularly television, will have views that reflect the dominant messages that they see (Morgan et al., 2009). Studies in this tradition thus compare the views, attitudes, and behaviors of those who watch more television (heavy viewers) with those who watch less television (light viewers). As television tends to be a gender-stereotyped world, using this general paradigm, we can posit that those who watch more television have more gender-role stereotyped views about men and women.

It is important to note, however, that studies of television's impact or effects are generally hampered because it is almost impossible to find control groups who do not watch any television. Moreover, those who do not watch television tend to be a small but quite eclectic group (Jackson-Beeck, 1977). Consequently, the overall effects of many of these studies are small because even light viewers watch several hours of television a day and experience many of the same things as those who watch more television (Morgan et al., 2009). Consequently, on one level, the deck may be stacked against finding relationships between viewing and espousing specific conceptions about the world, such as gender roles.

Cultivation of Gender-Role Images

The influence of the mass media, especially television, upon conceptions relating to gender roles examines how media may shape people's, and especially children's, views of what it means to be a man or a woman. This, in turn, may aid or abet goals

(occupational, educational, personal) a person may set out to achieve. Clearly the evidence points to the fact that society's notions of appropriate roles for men and women have changed (Signorielli, 1989). But, as noted above, television's images have not kept pace.

The research, including several meta-analyses, points to the existence of a relationship between television viewing and having more stereotypic conceptions about gender roles. Several meta-analyses have found support for this relationship. Herrett-Skjellum and Allen (1996) examined 19 nonexperimental and 11 experimental studies dealing with television and gender-role stereotypes and found an average effect size of .101. They also found all positive relationships and no age-related patterns, concluding that for these studies, particularly those using nonexperimental designs, television viewing is particularly related to conceptions about occupations. Morgan and Shanahan (1997), in a meta-analysis of all published studies relating to cultivation theory, found an average effects size of .102 in the analysis of 14 cultivation studies relating to gender roles. Likewise, Hearold's (1986) meta-analysis of 230 studies found that television viewing had a significant effect on gender-role stereotyping. Finally, the most recent meta-analysis (Oppliger, 2007) examined 31 primarily nonexperimental studies of adults. This analysis found a positive and statistically significant relationship ($r = .117$) between exposure to gender-role stereotypes and gender-typed behaviors and/or attitudes between both adults and children. Moreover, the correlations were similar for both males and females and were somewhat stronger for measures of behavior than attitudes.

One of the first studies conducted in the paradigm of cultivation theory looking at the relationship between viewing and espousing more or less sex-typed views, found support for this relationship. Signorielli (1989) in an analysis of the NORC General Social Surveys fielded between 1975 and 1986, found support for a general hypothesis that those who watch more television have more sexist views. She also found support for a mainstreaming hypothesis that groups of respondents, who espouse very different views when they are light viewers, have more similar outlooks in regard to women's role in society as heavy viewers. This analysis found that even though there was a decrease in the number of respondents who agreed with sexist statements between the 1970s and 1980s, television viewing was related to the maintenance of notions of more limited roles for women in society, particularly in regard to politically-oriented issues.

A recent reexamination of this hypothesis using data from the GSS fielded between 2000 and 2006 (Shanahan, Signorielli, & Morgan, 2008), found that this relationship had diminished. The authors suggest several reasons for this finding. First, and maybe most important, the GSS questions used to create the dependent measure in the two analyses are different because the questions asked between 1975 and 1986 in the GSS were no longer part of the questionnaire fielded between 2000 and 2006. Hence, the second analysis used different questions relating to gender roles. Second, people's conceptions about gender roles may have reached the ceiling because today most people are cognizant of real-life demographics that have pushed more women into

jobs, choosing smaller families, lower marriage rates, and so on. While television is slowly catching up with social reality, it is not surprising that cultivation relationships have diminished or disappeared in all but a few groups. Moreover, there is also some evidence that television may cultivate acceptance of nontraditional families such as unmarried women having children (Morgan & Shanahan, 1997).

Nevertheless, several studies show evidence for the relationship between media use, particularly television viewing, and expressing more sex-role stereotyped views. In particular, television cultivates more sexist attitudes in specific race/ethnically defined subgroups. Rivadeneyra and Ward (2005) examined the relationship between gender role attitudes and television viewing among Latino high school students in the Los Angeles area. Using a check list of English-language and Spanish-language prime-time programs, soap operas and talk shows, students' average monthly viewing was determined. Two measures of viewer involvement, motivation for viewing and identification with 16 specific television characters, were also collected. Gender-role attitudes were measured by a three-item feminism scale that included items such as "the husband should make all the important decisions in the marriage" and "a wife should do whatever her husband wants" (p. 462).

In general, Latino youth watch more television than European-American youngsters and, in this sample, the Latino girls watched more television than the boys. Those girls who watched more television, especially talk shows and situation comedies, were more likely to endorse more traditional gender-role stereotypes. In addition, watching more Spanish-language programs contributed to the expression of more traditional gender-role attitudes. Finally, perceived realism and viewer involvement were also related to expressing more gender-role stereotyped attitudes. The boys in the sample did not show the same degree of stereotyping, perhaps because they did not watch as much television as the girls, particularly those programs with more overall stereotyping. Moreover, the authors suggest that more stereotyped views for the boys were not found because the boys began with more traditional attitudes and findings may not have emerged because of existing ceiling effects.

In a study of 287 adolescents using measures taken at two points in time, Morgan (1987) found that television viewing made an independent contribution to adolescents' gender-role attitudes over time, but that television viewing was not related to some of their specific behaviors in relation to seven specific chores. Signorielli and Lears (1992), in a cross-sectional replication of this analysis with a sample of children in the fourth and fifth grade, also found statistically significant relationships between viewing and having gender-typed attitudes toward chores but no relationship between viewing and actually doing gender-stereotyped chores. Moreover, attitudes toward gender-stereotyped chores and actually doing girl- or boy-chores were related but gender-specific. Children, particularly those who said they watched more television, had more stereotyped ideas about who should do which chores, and were more likely to do those chores traditionally associated with their gender.

One area in which we continue to find relationships between viewing and conceptions about sex roles is in relation to occupations. While family and friends play a

large role in children's socialization about work, television's images have consistently made important contributions because television characters are seen frequently and are attractive role models. As noted above, however, television presents a rather limited picture of occupations, particularly for women and minorities, which over-represents exciting jobs and shows few characters actually working.

Signorielli (1993) found support for the relationship between television viewing and conceptions about male and female roles in a study analyzing data from the Monitoring the Future survey fielded in 1985. This analysis found that high school students' conceptions about work reflected two contradictory views about work that often appear on television. Television viewing was related to (1) adolescents wanting to have high status jobs that would also give them a chance to earn a lot of money and (2) wanting to have jobs that were relatively easy with long vacations and time to do other things in life. Hoffner et al. (2008), in a study of college freshmen, found that parents' views and the types of jobs their parents held as well as television contributed to students' attitudes and aspirations about work. Those youngsters whose favorite characters had an "easy job" also said that they would like to have a job that was easy; in short, they wanted to be like characters rarely seen working.

Similarly, Levine and Hoffner (2006) found that high school students got information about working and job requirements from parents and having a part-time job. At the same time they cited the mass media, although with some skepticism about the degree of accuracy, as providing information about work. The students said that dramas presented more negative views about work and gave the impression that work was difficult and stressful but that situation comedies provided positive information but mostly that work was easy and enjoyable.

Watching other media is also related to having more gender-role stereotyped views. Behm-Morawitz and Mastro's (2008) study of undergraduates found that those who watched and enjoyed teen movies (e.g., *Mean Girls*) saw female friendships in more stereotyped ways and did not have very favorable attitudes toward women. Moreover, watching and liking these movies led to the perception that being more socially aggressive may increase popularity with peers. Similarly, an experiment found that gender-role stereotypes may be influenced by commercials (Pike & Jennings, 2005). First and second grade students were placed in one of three conditions: (1) *traditional* who saw toy commercials in which boys played with gender neutral toys (e.g., *Harry Potter Legos* and *Playmobile Airport Set*), (2) *nontraditional* who saw the same commercials with the boys' faces digitally replaced by very feminine girls' faces, and (3) a *control group* who saw non-toy commercials (e.g., *Chuck E. Cheese Restaurants* and *Lucky Charms*). The results indicated that those children, particularly boys, in the nontraditional group were likely to say both boys and girls could play with gender-neutral toys while those in the traditional group said that only boys should play with gender-neutral toys.

Studies have also found relationships between watching music videos, especially rap videos, and conceptions about gender roles. As noted above, music videos tend to present very gender-stereotypical behaviors with rap videos often presenting

women as sex objects (Arnett, 2001). Bryant (2008) found that greater exposure to rap videos was related to Black adolescents having more adversarial ideas about male-female relationships and agreeing with the negative images of men and women in these videos. Interestingly, those youngsters who expressed higher levels of spirituality were less likely to accept the negative images of women, men, and male-female relationships portrayed in these videos. Studies have shown that younger African Americans do not necessarily like the way women are presented in rap music videos but, at the same time, are not necessarily opposed to these portrayals (Kitwana, 2002).

Ward, Hansbrough, and Walker (2005) found that African American high school students who watched more music videos and more sports programming had more traditional gender-role stereotyped attitudes and said that attributes such as being cool, athletic, rich, and attractive were important. On the other hand, viewing prime-time situation comedies, dramas, and movies was not related to more gender-role stereotyped views. In addition, an experiment, conducted as part of this study, found that those students who saw clips of music videos with very stereotypical portrayals of both men and women expressed more stereotyped and traditional views about sexual relationships and gender.

Conclusion

This review has explored gender-role socialization looking particularly at studies conducted at the end of the twentieth century and during the first decade of the twenty-first century. Overall, research shows, in venue after venue, that women are underrepresented, typically making up 40% of the characters. Moreover, the presentation of gender roles on television reveals a stable image that, in most cases, is very supportive of the status quo, especially in relation to race, and age. Interestingly, women who do not fit stereotypical molds on one dimension of their characterization, such as their occupation, often revert to very traditional gender-role stereotypes in relation to their interpersonal relationships with men. These images serve to support the notion that women should not outshine men, particularly those to whom they are married and/or have an ongoing romantic relationship (IMHI, 1997).

Recent studies on the impact of such images in regard to conceptions about gender roles are somewhat limited but still point to the existence of a relationship between television viewing and having more stereotypic conceptions about gender roles particularly among high school and college students. Support comes from studies conducted in both experimental and nonexperimental settings. In essence, television may be contributing to the maintenance of notions of more limited roles for women in society because the images seen on television typically foster the maintenance of the status quo compared to men's and women's roles in society.

Finally, we are just beginning to make inroads in understanding the powerful impact of this medium on our lives. It is imperative, however, that we continue to

expand our research on television's effects, as well as continue to monitor how men and women are portrayed in the media because new venues for viewing, particularly for children, may increase exposure to media images. This research, however, must be driven by specific information from ongoing studies of television content rather than suppositions about images in television programs. At the very least, continued research can help raise awareness of television's potentially stereotypical and perhaps problematic images and how such images may impact our lives.

Race and News Revisited

The Content and Effects of Problematically Framing the News

Travis L. Dixon and Christopher S. Josey

ABSTRACT

Over the past many decades, scholars have extensively studied the portrayal of persons of color in the media and its effect on the individual. In this chapter we will devote particular attention to the ways in which race has been framed within the context of news in traditional (e.g., televised or print) and new media (e.g., online). A critical synthesis of the extant literature will be offered for traditional media, followed by a discussion of findings from effects-based studies. Next, we provide an overview of what is known from the study of persons of color in online news, drawing similarities and contrasts where appropriate to traditional media. Lastly, we discuss the shortcomings of current research paradigms, pointing to directions for future research.

Studying Race in the News

Scholars have been interested in the ways that persons of color have been portrayed in the mass media for much of the last century (Greenberg, Mastro, & Brand, 2002; Chapter 13, this volume). Early work focused on how persons of color, most often Blacks, were portrayed in entertainment media such as films and television. More recently, scholars also have turned their attention to detailing the ways in which race

is framed by news organizations (Dixon & Azocar, 2006; Dixon & Linz, 2000a, 2000b, 2002; Entman, 1994, 1992; Entman & Rojecki, 2000; Gilliam & Iyengar, 2000, 1998; Josey, Dixon, Hurley, & Hefner, 2010; Romer, Jamieson, & de Coteau, 1998; Simon & Wright, 1996). News organizations are charged with accurately reporting events that happen across the globe. Thus news, because of its very nature, is crucial to study as consumers may interpret it as an *accurate* representation of reality. Research examining the portrayal of race in news content finds that persons of color are represented in highly stereotypic ways (Greenberg et al., 2002). Thus, it is likely that these problematic portrayals of persons of color may cultivate incorrect or stereotyped views of minorities for news viewers. These views, in turn, can have a multitude of deleterious *real-world* effects in the way individuals view and treat persons of color.

The title of this chapter is “Race and News Revisited.” In writing it we have two goals. First, we will synthesize prior research findings that detail the portrayal of race in news content and its possible effects. Second, we will explain how the changing nature of news content warrants revisiting prior research paradigms regarding race and news. To begin this chapter, we will consider the content analytic work that has been conducted in traditional media (e.g., print and television). We will then detail experimental findings from effects-based studies. Finally, we move beyond traditional media to consider emerging work in online news, pointing to areas for future research.

The Framing of Race in Traditional Media

Studies examining the framing of race in news programming have largely focused on television (Dixon, Azocar, & Casas, 2003). This is both intuitive and reasonable as most individuals relied on local and national news broadcasts as their primary information sources until recently (Josey et al., 2010). Initial studies in this area have primarily examined the portrayals of two minority groups: Blacks and Latinos (Dixon & Azocar, 2006; Dixon & Linz, 2000a, 2000b, 2002; Entman, 1992, 1994; Entman & Rojecki, 2000; Gilliam & Iyengar, 1998, 2000; Gilliam, Iyengar, Simon, & Wright, 1996; Romer et al., 1998). This is largely the case because Blacks and Latinos are seen with greater frequency in news coverage, while other groups remain virtually invisible (Josey et al., 2010). Further, as Blacks and Latinos represent the two largest minority groups in the United States, it is only natural that a great deal of empirical focus has been devoted to representations of them as racial groups. Thus findings for Blacks and Latinos are generally much more robust than those for other racial groups such as Native Americans, Arabs, and Asians (Heider, 2000; Josey et al., 2010; Merskin, 1998; Oswald, 2005; Person & Musher-Eizenman, 2005). We begin by reviewing content analytic findings about the portrayal of Blacks and Latinos in traditional media.

Content Studies of Local News Programming

One of the first and most notable series of investigations was undertaken by Robert Entman and his colleagues, who performed a quantitative content analysis of 55 days of local television news in Chicago to determine if there were any systematic differences in the portrayal of Black and White suspects. Entman (1990, 1992) found that Black men accused of a crime were much more likely than similarly accused White suspects to be shown in the grip of a restraining police officer. Thus traditional news media portray Black men as needing restraint, requiring state intervention, and, consequently, as predators to be feared. Entman also found that Black men accused of committing a crime were less likely than White suspects to be identified by name in news stories. Entman interpreted such differences as evidence that when Black and White suspects are accused of similarly serious offenses, Black suspects appear to be treated in a more “dehumanized” manner. Whereas White suspects have individuating names, Black suspects are anonymous and members of a racial out-group. This is part of a long-standing narrative claiming that Black men are criminals. Moreover, Entman maintained that those Black suspects who were most dehumanized were portrayed as being the perpetrators of violence against White victims. These images appear to suggest that while crime is always a terrible event, it is even worse when committed by a Black man against a White victim. While limited to 55 days of coverage in Chicago, Entman’s findings suggest strongly that the television news perpetuated a series of stereotypical depictions where Black suspects were violent, nameless, and particularly inclined toward attacking White victims.

Although Entman (1990, 1992) limited his investigation to local Chicago stations, such stereotypical depictions are not confined to Chicago news. For example, Romer et al. (1998) analyzed the 11:00 p.m. news broadcast for three stations in Philadelphia over 14 weeks. In each of the stories, Romer and his associates coded the ethnicity of primary actors (i.e., “person of color” or White) and they recorded their roles (i.e., victim or perpetrator). Echoing Entman’s (1990, 1992) conclusions for Chicago, Romer et al.’s (1998) study found that Black Philadelphians were more likely to be shown as perpetrators than as victims in the news. In addition, Romer and his team found evidence that White Philadelphians were overrepresented as victims, and that these portrayals of White victims were driven by an overrepresentation of Black perpetrators. So even though crime reports indicated that only 10% of White victims are murdered by Black offenders, Philadelphia TV news depicted a world where 42% of White victims were murdered by Black thugs – *this amounts to an overrepresentation of Black-on-White murder by a factor of over 400%*.

Similar findings have emerged in studies by Dixon and Linz (2000a, 2000b) and by Gilliam and colleagues (1996, 2000) for the Los Angeles area. These studies reveal several findings. First, compared to crime reports, Blacks are overrepresented as criminal suspects in local news programs. On average, crime reports indicate that Blacks make up about 21% of actual perpetrators in the Los Angeles area, yet they

appear as perpetrators about 37% of the time on Los Angeles area news (Dixon & Linz, 2000a). As in Chicago and Philadelphia, television news in Los Angeles systematically fills viewers' heads with racialized images that perpetuate the stereotype of young Black men as a violent threat to society.

Moreover, research has shown that Blacks are generally associated in TV news with negative roles. For example, Dixon and Linz (2000a, 2000b) found that Blacks are more than twice as likely to appear as criminal suspects than as officers on news programs – put simply, television news depicts Black men as criminals, not as law-protecting police officers. Similar to the Romer et al. (1998) study, Dixon and Linz (2000a) also found that Black men are more likely to appear as perpetrators than as victims in the news in Los Angeles area news programs. In fact, when compared to crime reports, Blacks are underrepresented as homicide victims on local television news. Whereas Blacks represent about 23% of the victims portrayed in television news, they account for almost 30% of the actual victims in the Los Angeles area. Given that being a victim of crime puts one in a position of sympathy in most viewers' eyes, this underrepresentation of Black victims amounts to yet another subtle way that Black experiences get downplayed. Finally, Blacks are twice as likely as White suspects to have negative pretrial publicity aired about them in the news (Dixon & Azocar, 2006; Dixon & Linz, 2002). For example, for Black suspects on television news, the news story is more likely (than for White suspects) to air the fact that they have committed crimes in the past. This reporting of past deeds is important because the American Bar Association has identified negative pretrial publicity as a hindrance to the constitutional principle of a fair trial. The bedrock commitment of our justice system, the belief that one is innocent until proven guilty, may be jeopardized by the mass-circulation of racial stereotypes.

The Portrayal of Latinos in News Programming

Latinos as a racial group have received far less attention across media types or genres (Greenberg et al., 2002). Analyses of Latinos in news programming and stories are few in comparison to those analyzing the portrayal of Blacks (Dixon & Linz, 2000a). What little research that exists on the topic, however, points to some stereotypical depictions that coincide with those of Blacks and some that diverge. Heider (2000) found that news coverage of Latinos centered on either crime or cultural festivals. In one of the first quantitative studies to assess the portrayal of Latinos in news, Sorenson, Manz, and Berk (1998) found that, when compared to real-world indicators, Latinos were underrepresented as suspects in homicide cases in print news. They also received less coverage as victims of crime. In a similar study, Dixon and Linz (2000a) found that Latinos were underrepresented as both perpetrators and officers when compared to real-world indicators. Further, Dixon and Linz (2000b) found that Latinos were underrepresented as victims of crime when compared to crime statistics. Dixon and Linz make the case that these findings are largely due to a high degree of underrepresentation and virtual absence of Latinos in news programming.

Studies conducted more recently have found similar patterns. Poindexter, Smith, and Heider (2003) found that Latinos were underrepresented as criminals in local news, accounting for only 2% of all perpetrators. In the same study, Latinos were less likely than Whites to be interviewed by reporters or be seen as reporters in news programming. In other content studies, Latino juveniles were more likely to be portrayed as lawbreakers than Whites (Dixon & Azocar, 2006). However, they were underrepresented when compared to crime reports.

The Portrayal of Whites in News Programming

As the largest racial group in the United States, Whites occupy a place of privilege and power in both the physical and mediated world (Clark, 1972; Lipsitz, 1998). As such, one would expect to see Whites portrayed in a much more positive manner across all media forms and content. Previous analyses have shown that Whites receive a larger portion of positive and sympathetic roles in news programming (Greenberg et al., 2002). Romer et al. (1998) found that in non-crime stories, Whites are equally likely to be portrayed in frequency compared to Blacks. However, in crime-related stories, Whites were less than half as likely as Blacks to be seen as perpetrators of crime and Whites occupied the majority of victim roles in televised news. Sorenson et al. (1998) found that Whites received more coverage in sympathetic roles such as victims of crime in print news as well.

Dixon and Linz (2000a, 2000b) found that Whites are underrepresented as both violent and felony perpetrators when compared to crime reports. Whites were less likely to be seen as lawbreakers in general than other racial groups, more likely to be seen as police officers than suspects, overrepresented as police officers and underrepresented as perpetrators of crime. Further, Whites were more likely to be seen as victims of crime in general than minorities, especially in homicide stories. One of the things we have been taught to forget by news biases is that a significant number of crimes are committed by White criminals; however, research indicates that White men make up only about 20% of the perpetrators shown on local television news (Dixon & Linz, 2000a, 2000b). By overemphasizing the crimes committed by Blacks and Latinos, and by underportraying the crimes committed by Whites, the news media racializes crime, showing it not as a communal dilemma to be addressed by all, but as a specifically racial problem in which predatory minorities victimize innocent White citizens. This systematic pattern of racializing news stories about crime depends in part on showing Whites as the upholders of law and order. This stereotypical local news depiction suggests that law and order is the province of White police officers, whose job is to defend White victims from Black and Latino villains. When inundated with such images, day in and day out, year after year, there can be little wonder that so many US citizens support harsher penalties for crime sentences.

Portrayals of Other Marginalized Groups in News Programming

The study of race and news has largely used a Black/White dichotomy. Only recent analyses include the study of Latinos and other racial groups (Josey et al., 2010). As

such, findings are limited. Whether this is due to the relative infrequency of these portrayals in news creating a lack of statistical power for comparisons, or just a lack of interest is currently not known. Three groups will be briefly discussed to understand what is known in this area: Asian Americans, Native Americans, and Arabs/Arab Americans.

Investigations into how Asians are portrayed by the media have received relatively little attention in comparison to Latinos and Blacks (Poindexter, Smith, & Heider, 2003). Poindexter and colleagues found that Asian Americans were less likely than Whites, Blacks, or Latinos to be the focus of news stories. Further, they were significantly less likely to be news reporters or interviewees for news stories. However, when Asians are featured in news, studies have demonstrated that Asians are portrayed as *model minorities* (Wong, Faith, Nagasawa, & Lin, 1998). Wong and colleagues note that the model minority is characterized as obedient, hard working, and non-confrontational. This status largely causes Asians to be ignored from discussions of race and associations with problematic social issues.

Native Americans may have been the original settlers of North America, yet in the overall media landscapes they make up a miniscule proportion of the overall characters (Greenberg et al., 2002). When studies have found portrayals of Native Americans, they tend to be highly stereotypic (Merskin, 1998). Specifically, the roles offered are based on ancient notions of the brave warrior or involve some sort of highly mystical cultural practice. In news, Native Americans are largely invisible (Heider, 2000; Poindexter et al., 2003). When they are seen, they largely appear in stories revolving around sports mascots, alcoholism, gambling, or cultural festivals.

The final marginalized group to consider is that of Arabs/Arab Americans. Since 9/11, there has been an increased focus on how Arabs and Arab Americans have been portrayed in news media (Oswald, 2005; Person & Musher-Eizenman, 2005). Previous studies have demonstrated that Arabs in general are associated with issues of terrorism. However, research on these types of portrayals is largely still in its formative stages and has yet to yield robust results. Taken together, these findings show that outside of Latinos, Whites, and Blacks, other racial groups have received scant attention in the extant literature. Further study is needed to examine these portrayals using larger samples to hopefully draw meaningful statistical comparisons.

Summary of Content Analysis Findings in Traditional News Programming

Taken together, content analysis findings paint a bleak picture regarding the portrayal of race in traditional news programming. One could easily summarize the extant research with the following statement: Minorities occupy significantly more negative or stereotypic roles in news programming than Whites. Specifically, Blacks are over-represented as criminals, underrepresented in positive roles (e.g., police officers), and are more likely to be seen as the perpetrators of violent crimes. This general pattern

holds true regardless of the medium or level (e.g., local or network). Latinos are severely underrepresented when compared to crime and population rates. However, when they are seen, they are more likely to be seen as perpetrators of crime than victims or police officers. Whites, as a racial group, maintain a level of privilege in the news media. This is evidenced by sympathetic and positive roles. When compared to actual population data and crime reports, Whites are underrepresented as lawbreakers and overrepresented as victims (especially homicide victims). Finally, other marginalized racial groups are seldom seen in news, yet still portrayed in problematic manners. These findings suggest that news outlets dichotomize stories along classic racialized lines (Dixon & Linz, 2000a, 2000b; Entman, 1990, 1992; Josey et al., 2010; Romer et al., 1998; Sorenson et al., 1998). Here minorities are presented as *superpredators*, victimizing innocent Whites who attempt to uphold the law and societal values. Obviously, such scripts may have important implications for the ways individuals perceive and treat persons of color. As such, we now turn our attention to experiments that attempt to detail such effects and the theories that explain them.

How Stereotyped Media Content Affects the Individual

Experimental research in the area of the portrayal of race in news relies on several related theories. The first is the *cultivation hypothesis* which postulates that consumers of media will grow to have expectations of the real world similar to those found in the media they consume (Gerbner, Gross, Morgan, & Signorelli, 1980; Chapter 2, this volume). Thus, the cultivation hypotheses would postulate that the more consumers view stereotyped news content (e.g., Blacks as criminals) the more likely they would be to see that as a reflection of reality. Most often applied to survey research, cultivation has also been applied in experimental methodology, as well.

The next major theoretical tool used by scholars in experimental research is the theory of associated networks. Bower (1981) describes the way that individuals store and access information as a series of associated networks. Each network has a set of nodes that represent a piece of information. Some overarching concept or schema in turn links these nodes into a network. Networks of nodes are linked in a superstructure where activation of one construct *spreads*, activating others (Aldrich, Sullivan, & Borgida, 1989; Graber, 1988). Such activation is often referred to as spreading activation (Valentino, 1999). Important in this model are the powerful effects of priming. Priming refers to how exposure to a meaningful stimulus (e.g., race) brings to mind related concepts (e.g., crime) stored in memory (Berkowitz, 1984, 1990; Chapter 3, this volume). Thus, spreading activation and the associative networks model of cognition serve as explanations of priming effects observed in experimental research. Two concepts are key for the understanding of how this model explains news exposure effects: accessibility and application.

Accessibility

Accessibility is the ease with which a network of nodes can be activated and used by an individual (Fiske & Taylor, 1991; Valentino, 1999). Repeated use of any construct makes it better developed and chronically accessible. Chronically accessible constructs are stable over time representing strongly held beliefs, which in turn are likely to be used when evaluating a stimulus. Networks can also be accessed because they were used recently or brought to mind from exposure to a stimulus (e.g., priming). It is widely agreed that accessibility (either chronic or recent) is a necessary condition for the use of stored stereotypic information. However, there is still debate regarding whether it is a sufficient condition to generate any deleterious effects or application of those cognitions.

Application

Some scholars would disagree with the notion that because a series of nodes is well formed and chronically/temporarily accessible it is more likely to be used when evaluating a stimulus (Devine, 1989). Devine argues that individuals can circumvent this process given the appropriate amount of cognitive resources and a high degree of motivation. Thus, accessibility of a construct is necessary but not sufficient to explain the use of stereotypes. For Devine and others, it is entirely possible for individuals to have a Black stereotype schema that is highly accessible and tightly developed, yet not use it if they are highly motivated and have the appropriate resources at their disposal.

In short, the cultivation hypothesis suggests that racialized news may contribute to the formation and maintenance of stereotypes in individuals. These stereotypes are represented as schema or associated networks in memory. The more news one consumes, the more likely they will chronically access and use these networks. The chronic access and use of these networks create more developed stereotype schema in one's memory. These schema will have a lower initial-activation threshold, making them more likely to be used when an individual is primed by racial cues in news. This can ultimately have a multitude of deleterious effects on participants' attitudes, behaviors, beliefs, and emotions if one is not motivated to avoid relying on stereotypic schema.

Experimental Research in Race and News

Experiments studying the effects of stereotypic news coverage have proven quite fruitful. As with content studies, experimental work largely focuses on issues of crime and Blacks. In general, experiments find an association between exposure to stereotypic stories and negative evaluations of minorities. These studies most often rely

on priming as a theoretical justification for their results. Thus, exposing individuals to racialized news reports activates stereotypic schema that may be used to evaluate minorities (Devine, 1989; Dixon, 2006, 2007, 2008; Dixon & Azocar, 2007; Dixon & Maddox, 2005; Ford, 1997; Gilliam & Iyengar, 2000; Oliver, 2003; Valentino, 1999). However, this trend is qualified by a number of moderating variables such as news viewing habits and existing racial attitudes.

Experimental Research Using Priming

In one of the earliest experiments, Peffley, Shields, and Williams (1996) exposed White college students to news stories featuring either Black or White suspects. The stimulus stories were identical except for the manipulation of inserting either a Black or White suspect photo into the video. They found that those exposed to Black suspects rated the character as guiltier than those who saw the White suspect. Additionally, those exposed to the Black suspect condition felt that the criminal would engage in a similar behavior in the future more so than those who saw the White suspect.

In another early study, Johnson, Adams, Hall, and Ashburn (1997) had participants read a series of news stories. These stories contained articles that were either violent (e.g., mugging) or nonviolent (e.g., surgeon general warnings). Following exposure to these news stories, participants read a vignette about a criminal act where the criminal's race was varied (e.g., White, Black, not specified). Results indicated that those exposed to violent news stories attributed blame for the crime to personal rather than situational factors when the criminal was Black. The same was not true for the other manipulations (e.g., White or race unspecified) or for participants in the nonviolent conditions. Important in this study is that Johnson et al. did not prime race explicitly as in the Peffley et al. (1996) study. Johnson et al. (1997) take this as evidence of spreading activation such that implicit primes of violence activate related stereotypic schema for participants. These, in turn, are used when evaluating the fictitious Black criminal. Other studies have found similar implicit priming effects (Dixon, 2007, 2008).

Studies have also found powerful priming effects on behavioral outcome measures such as support for political candidates after exposure to racially coded news stories. Valentino (1999) argues that local crime coverage activates racial attitudes, which are then used to evaluate and make decisions regarding candidates. He exposed participants to either no crime story, a nonminority crime story, or a crime story with minority suspects. Following exposure, participants rated, then, President Clinton on a number of race-associated issues (e.g., crime and welfare) and non-race associated items (e.g., taxation). Valentino found that following exposure to crime news, President Clinton's performance on crime was rated lower by those who saw no minority suspect and lowest by those who saw a minority suspect. Further, evidence of spreading activation was found such that Clinton's performance on related *race-*

associated issues (e.g., welfare) was lowest for those who viewed a minority crime story despite not being explicitly primed with stories involving those issues in the manipulation. This was not the case for non-race associated issues (e.g., taxation). His results provide support for the notion that race need not be explicitly primed to activate race-related stereotypes.

Other scholars have examined the effects of racial primes on participant memory. In a series of studies conducted by Oliver and colleagues, participants were exposed to crime stories and asked to recall the race of the perpetrator (Oliver, 1999; Oliver & Fonash, 2002; Oliver, Jackson, Moses, & Dangerfield, 2004). Findings from these studies provide evidence for a schematic processing perspective. These theoretical notions suggest that the news media have overrepresented Black criminality so often that viewers automatically associate Blackness with crime.

In one of these studies, Oliver (1999) exposed participants to a series of televised news stories including either a Black or White criminal suspect. Immediately following exposure, participants were asked to look at a series of photographs of Black or White suspect photos used in the stories as well as those that were not used in the stories. They were then asked to rate the likelihood that each photo was of the suspect from the story they just read. Results indicated that there were no priming effects for misremembering the race of the suspect featured in the embedded article. However, when participants were asked to return three months later and repeat the same task, results indicated that those who viewed the White suspect were significantly more likely to misremember the suspect as being Black. Oliver speculates that this effect is due to participants forgetting the race of the suspect over time and relying on existing schema to fill in the missing information.

In a similar study, Oliver and Fonash (2002) exposed participants to newspaper crime stories that featured both violent and nonviolent crimes. The stories contained photographs of both White and Black suspects. After exposure to these series of stories, participants were presented with photos of White and Black individuals and asked if they had been featured as part of the story. Findings indicated that when subjects misidentified photos as being featured in the crime news stories, it was more likely to be along racial lines (e.g., foiler Black photos misidentified as actual Black stimulus photos). Further, misidentification was higher for photos of Blacks than Whites in violent crime stories. There were no differences in nonviolent stories. Of note in this study and others performed by Oliver and colleagues, is that regardless of expressed racial attitudes, misidentification was higher for photos of Blacks than Whites in violent crime stories. However, Oliver and colleagues (Oliver, 1999; Oliver & Fonash, 2002; Oliver et al., 2004) were explicitly measuring the effect of priming on participant memory and not other important outcome measures (e.g., evaluations of Blacks, actual behavior or support of race-associated issues).

Taken together these studies illustrate the powerful effect of priming on a number of outcome measures. First, explicit priming of race schema affects evaluations of Black criminal suspects. Second, implicit primes using *race-coded* issues (e.g., violent crime) causes spreading activation that leads to similar prejudicial judgments. Third,

when asked to identify an out-group member (e.g., Whites identifying Blacks), participants are increasingly forced to rely on existing associative networks and schema to make decisions. This causes more misidentification of out-group members, especially over time. Yet despite these robust findings, the above studies do not illuminate the role that prior racial attitudes may play in the evaluation of persons of color, *race-related* issues, or actual behavior. In addition, they do not provide explicit support for a cultivation effect. As such it is necessary to examine how racial attitudes and news consumption may moderate or exacerbate these effects.

Racial Attitudes as a Moderator

It is intuitive that existing racial attitudes could play a central role on how individuals interpret and react to racialized news messages. The associative networks model (Bower, 1981) posits that individuals who have highly developed and accessible stereotype schema should have those schema accessed more easily than those who do not, when exposed to racial primes in news. Accordingly, it is evident that measuring existing racial attitudes could explain important differences in reactions to racialized news. Further, measuring such attitudes provides scholars with an opportunity to hold them constant in analysis; parsing out the unique role that news consumption plays in the reaction to racial primes in news. As such endorsement of racial stereotypes is one of the most well-researched moderators in experimental studies of the effects of racialized news (Dixon, 2008).

Most studies have evidenced endorsement of racial stereotypes as a powerful moderator of priming effects and participant responses on attitude/behavioral measures (Dixon, 2008; Domke, McCoy, & Torres, 1999; Entman & Rojecki, 2000; Gilliam & Iyengar, 1998; Gilliam et al., 1996; Peffley et al., 1996). Other research paradigms (Oliver & Fonash, 2002; Oliver et al., 2004) have failed to detect a moderating influence of prior racial attitudes on participant memory. In studies examining the relationship of stereotype endorsement and support for punitive crime policies, the general trend is that those who are exposed to primes involving Blacks are more likely to support such policies (Gilliam & Iyengar, 1998; Gilliam et al., 1996). These patterns are particularly enhanced for those who endorse stereotypes of Blacks (Dixon, 2008; Domke et al., 1999; Entman & Rojecki, 2000; Gilliam & Iyengar, 1998; Gilliam et al., 1996; Peffley et al., 1996).

In a study conducted by Dixon (2006a) participants were exposed to news coverage of a majority of Black or race-unidentified suspects. He found that those who endorsed Black stereotypes were more likely than those who did not to support the death penalty. Further, he found that those who consumed the most news rated offenders as being more culpable than those who consumed less news. In a similar study, Dixon (2008) exposed participants to a crime story where race was manipulated to have either a White, Black, or race unidentified suspect. He found that those who highly endorsed stereotypes found the Black and race unidentified suspects highly threatening and culpable for their behavior. Results indicated a greater support for punitive crime policies for stereotype endorsers. Similar results

have been found using different primes for White participants (Gilliam & Iyengar, 1998, 2000).

On the whole it appears that endorsement of racial stereotypes amplifies negative evaluations of Blacks and of issues associated with Blacks as a racial group. This, of course is both intuitive and in keeping with prior research. However, as Dixon (2007) points out, findings such as these do not really speak to the unique role that repeated news viewing plays in this process.

News Viewing as a Moderator

Examining the role of the amount of news consumption as a potential moderator of the priming effects noted previously is crucial for scholars inclined to believe in a cultivation explanation for racial attitudes (Dixon, 2007). According to the cultivation hypothesis (Gerbner, Gross, Morgan, & Signorelli, 1980, 1994) repeated exposure to media content should develop cognitive schema in individuals, which lead them to see the world in a way that is consistent with that presented by news programming. If the cultivation hypothesis holds true, endorsement of racial stereotypes, outward behavior towards persons of color and perceptions regarding *race-associated* issues (e.g., welfare and the death penalty) should be influenced by exposure to stereotypic news coverage. Thus, those who consume little or no stereotypic news should exhibit a lesser degree of racial bias in such judgments, while those who consume heavy amounts of stereotypic news should exhibit a greater degree of bias in line with stereotypic schema.

In examining the unique role that stereotypic news stories play in cultivating unrealistic views of minorities, scholars are now examining prior news consumption as a moderating variable (Dixon, 2007, 2008). In one such study Dixon (2007) exposed participants to news stories featuring either White, Black, or race unidentified suspects. He also exposed participants to stories featuring a police officer manipulation with the same racial breakdown. Dixon had participants indicate how much news they viewed and complete racial recall measures for suspects and police officers. He found that race unidentified perpetrators were rated by participants as being more likely to have been Black. Heavy news viewers expressed more confidence that the unidentified officers were White than did light news viewers. News viewing also predicted less liking of featured Black officers and more positive evaluations of race unidentified officers.

These results provide evidence for a cultivation effect because the effects were most pronounced for heavy news viewers. Content studies have shown that crime perpetrating is heavily coded as a *Black issue* whereas law enforcement is coded as a *White issue* (Dixon & Linz, 2000a). Heavy viewing of such news exposes individuals to the *Blacks as superpredators/Whites as officers* script (Gilliam & Iyengar, 1998). This viewing makes these schema of crime and Blacks highly connected and accessible (Shrum, 2001; Shrum & O'Guinn, 1993). Dixon (2007) makes the case that; as a result, race does not have to be explicitly primed for heavy news viewers to make such judgments in ambiguous racial situations. Thus, for heavy news viewers, one only

need prime the Black or crime schema to activate the other. Experimental research bears this notion out (Dixon, 2007).

Summary of Experimental Findings

Taken together, experimental studies illustrate a number of key points. First, prior stereotype endorsement and news viewing play a large moderating role in determining the effect of news primes on outcome behaviors and attitudes. In other words, news consumers will react differently when watching crime news that features persons of color depending on their existing racial attitudes and their news consumption habits. Second, even when race is unidentified, spreading activation may occur such that mentions of crime with no identifiable race might bring to mind Black stereotypes, that in turn are then used by those who consume the most news. Thus, priming with a Black suspect may be a sufficient, but not necessary condition for negative evaluations and behaviors. Next, these negative outcomes are most pronounced for heavy news viewers and less so for light news viewers, a strong indication of a cultivation effect. Therefore, greater levels of news viewing can encourage the adoption of a distorted view of race and crime more in line with televised depictions than real crime statistics. Further, as time passes, consumers are forced to rely on existing schema to fill in the gaps in memory, thus creating a stereotypic recall bias for individuals who were initially exposed to a violent crime story. Finally, these experiments point to the relative stability of negative outcomes regardless of whether the dependent variables access attitudes, beliefs, or behaviors.

Revisiting Race and News in a New Media Environment

While experimental work has begun to examine the extent to which print and televised media can affect individuals' evaluations of minorities, over the past 10 years a gap has begun to emerge in the extant literature. Early studies detailing the portrayal of race in news programming began in the early 1990s and continued well into the early 2000s. However, since that time, relatively few content analyses have been conducted extending Entman's (1990, 1992, 1994) and Dixon and Linz's (2000a, 2000b) findings. Part of this is due to the extreme stability of the findings across content studies in televised and print media. Yet during that time new media began to supplant television and print as a dominant information source (Pew, 2000). In fact, studies are now showing that the Internet has led to a decreased reliance on television/print news and increased use of online sources as the first line of information (Pew, 2000). This fact has important implications for scholars seeking to under-

stand the effects of media portrayals. As such, the second goal of this chapter is to revisit the portrayal of race in news. Particularly, it is necessary to examine any pertinent new findings and explain possible medium effects.

A simple literature search reveals that work detailing the portrayal of race in online news is largely absent in the academy (Josey et al., 2010). However, as people shift their information consumption habits from traditional media to new forms, it is necessary to understand not only content differences, but also effects differences. In the first and only published content analysis of the portrayal of race in online news, Josey and colleagues examined the top 13 online news websites as ranked by overall traffic. Their sample included both traditional news sources with online counterparts (e.g., *New York Times*) and sources that only had an online presence (e.g., Google and Yahoo News). They examined the portrayal of race on a number of important levels: headlines, images associated with stories, top and popular news stories. In determining the race of individuals in stories, images, and headlines coders were asked to use all available information presented in the story. As such they were able to infer race based on images published with the story, surnames traditionally associated with particular races (e.g., Rodriguez), explicit mention of a person's race and prior knowledge of a person's race (e.g., O. J. Simpson). Notable about this study is that Josey and colleagues expanded their codebook to include races other than Blacks and Latinos.

Josey and colleagues (2010) discovered that Whites were largely overrepresented in images associated with stories (over 75% of the sample) while Blacks, Latinos, and Asians were underrepresented. In headlines, a similar pattern emerged. Whites occupied the majority of portrayals in headlines (82.5%) with minorities being extremely underrepresented when compared to US census data. More problematic was the fact that when the most popular stories read by viewers were examined, these patterns were even more pronounced.

Similarly, stories selected by news websites as *top news* that were prominently featured on websites exhibited the same misrepresentations as popular stories. However, one might wonder what types of portrayals are being seen in such stories (e.g., regarding crime, welfare, etc.). Josey et al. (2010) examined one particular issue that has historically been associated with minority groups: poverty. Findings indicated that Latinos and Blacks were disproportionately overassociated with issues of poverty when compared to other racial groups. Whites and Asians were underassociated with poverty. This trend was most pronounced in top and popular news stories.

Thus, when revisiting the portrayal of race using online content a few general trends begin to emerge. Whites are overrepresented in benign or positive manners, occupying over 80% of the portrayals. Blacks, Latinos, and Asians are underrepresented in online news when compared to US Census data. Troubling is that Blacks and Latinos were associated with a highly stereotypic issue, poverty, while Whites and Asians escaped such associations. Most troubling is that these findings were especially pronounced in the news consumed most by readers that was also deemed *top news* by online news organizations. In short, it appears that online news

organizations are faring no better in portraying race in a balanced and non-stereotypic manner than their offline counterparts. In fact, it appears that in many cases such portrayals may be worse in online news than in traditional media. We will now briefly consider the implications of such portrayals in online news.

Effects of Online News Portrayals

Traditional media effects research relies on paradigms that involve linear, largely non-interactive media. However, the Internet and new media present users with the opportunity to expose them to whatever communication they desire (Josey, 2010; Josey et al., 2010; Chapter 23, this volume). In such a user-driven environment, standard theories and research paradigms may not adequately account for the possible effects racialized portrayals may have on an individual. For instance, one of the more dominant theories in media effects research, the cultivation hypothesis, may not adequately explain how an individual chooses some messages over others. Therefore, it may be more difficult to ascertain why and how an individual may be affected by new media content. Scholars are now beginning to examine older theories such as selective exposure as a means to explain possible media effects in a new media environment (Appiah, 2003; Josey et al., 2010; Knobloch-Westerwick, Appiah, & Alter, 2008; Melican & Dixon, 2008).

Selective exposure posits that individuals rely on existing cognitive networks, attitudes, and beliefs when deciding which messages to expose themselves to (Klapper, 1960; Lazarsfeld, Berelson, & Gaudet, 1948; Sears & Freedman, 1967). Thus, it is entirely possible that the greatest explanatory variable for news consumption in new media is prior racial attitudes. Although this notion has yet to be formally tested by scholars in an experimental setting, early survey research has provided interesting results. In a survey measuring credibility ratings of online news organizations, Melican and Dixon (2008) found that those who most endorsed racial stereotypes found nontraditional news outlets (e.g., *Huffington Post*) to be more credible than traditional news outlets (e.g., *New York Times*). The reverse was true for those who did not endorse racial stereotypes. Melican and Dixon posit that individuals selectively expose themselves to such sources based on existing racial attitudes. It is possible that content differences are present such that nontraditional news websites (e.g., *Drudge Report*, *Daily Beast*) adhere less strictly to traditional notions of journalistic objectivity than traditional news websites (e.g., *New York Times*, *LA Times*), thus introducing elements of clear bias on race-related issues (e.g., crime, immigration, welfare). Further, it is plausible that nontraditional news websites simply cover such issues with greater frequency and depth than traditional news websites thus making them more appealing and credible for those who hold more prejudicial belief systems. Melican and Dixon point to the need for further content research and experimental studies to fully explain their results. To date, no content analysis has examined the portrayal of race across traditional and nontraditional online news sources, probing

for critical differences that would explain these findings. In addition, no experimental study has been conducted to examine the role of existing racial attitudes on news selection. Thus one can only speculate that individuals motivated by prior news viewing and racial attitudes may seek out information that is in line with their existing beliefs. This represents one of the major voids in the race and news effects literature. We will now consider other notable voids.

Shortcomings in Prior Research

As we noted in the previous section, one of the most notable voids in the extant literature is a lack of grounded content analyses in online news. Specifically, no study to date has taken a comparative approach to probe for content differences between traditional and nontraditional news websites. Given the survey findings by Melican and Dixon (2008) it is likely that content differences may be present. Specifically, these nontraditional websites may present a more distorted stereotypic portrayal of minority groups. The fact that individuals who endorse racial stereotypes view such nontraditional websites as highly credible certainly suggests that some selective exposure is occurring.

The one published study that has examined the portrayal of race in online news raises some interesting questions that must be addressed. Josey et al. (2010) started from a framework that coded a number of stereotypes (e.g., crime, welfare, illegal immigration). Research in traditional media (Dixon & Linz, 2000a, 2000b; Entman, 1990, 1992, 1994) all focused on largely crime-based stereotypes. As evidenced by their study, other stereotypes are present in news content. As such future studies need to catalog and examine the multitude of problematic portrayals in new programming as they too may have important effects in the way people view and treat persons of color (Josey et al., 2010).

Next, both content and effects studies must extend their lens beyond the Black/White crime script. Future studies must investigate the powerful stereotypes unique to each racial group (e.g., Arabs and terrorism, Latinos and immigration). It is likely that just as the *superpredators script* of Blacks as criminals has real implications on individual beliefs and behaviors, other scripts may have important and substantive outcomes. Thus scholars must seek to understand these scripts and their effects.

Finally, scholars must begin to look for precursors to priming effects. Using theories such as selective exposure and attention, scholars can investigate how individuals select and attend to news. Given that individuals are turning more to online news outlets for their information, scholars must understand what, if any, effect prior attitudes and behaviors have on news consumption. This is especially important with respect to racial attitudes. Scholars have noted that the Internet is a safe haven for divergent and problematic opinions (e.g., hate groups) (Bargh & McKenna, 2004;

Josey, 2010). Thus if prior racial attitudes can drive exposure to some content over others, it is entirely likely that those who endorse stereotypes will consume news that strengthens the association between problematic social issues and persons of color.

The impetus for grasping the mechanisms behind such practices is clear. Scholars must revisit race and news. We must detail changes in content patterns as we move to an online news environment. We must design experiments to examine how individuals select, attend to and store racialized news content.

Conclusion

This chapter began with two goals. The first was to synthesize the extant literature regarding the content and effects of racialized news portrayals. The second was to revisit these findings in light of a new media environment. As has become clear, both traditional and online news underrepresents minorities in relation to actual US census data (Dixon & Linz, 2000a, 2000b; Josey et al., 2010). When minorities are represented, they are presented in highly problematic and stereotypic ways. In traditional news programming, Blacks and Latinos are represented as criminals, while Whites are seen as victims and upholders of the law. In online news, Whites are disassociated with problematic issues such as poverty, while Blacks and Latinos are portrayed as poverty stricken.

Effects-based research has demonstrated a clear link between many of these problematic portrayals and negative evaluations of Blacks. Existing racial attitudes tend to exacerbate such effects. More importantly for media scholars, experiments have demonstrated the unique role that news viewing plays in the cultivation of stereotypic beliefs. Specifically, heavy news viewers are more likely to hold negative evaluations of Blacks and use those evaluations on a number of outcome measures.

In the end, it is clear that the news media do a poor job in fairly representing persons of color. Considering the overall racial landscape in news programming, persons of color are seen with less frequency than one would expect. This is especially the case in online news (Josey et al., 2010). When they are seen, minorities are likely to be portrayed in stereotypic manners and occupy a disproportionately high percentage of negative news roles (e.g., as criminals and as poverty stricken), while occupying a significantly smaller amount of positive news roles (e.g., as police officers and as wealthy) (Dixon & Linz, 2000a, 2000b). Returning to the underlying theory behind this process, it is likely that repeated exposure to such highly stereotypic images, especially for heavy news viewers, cultivates highly accessible cognitive schema within viewers that link persons of color with highly problematic social issues and stereotypic behaviors (Dixon, 2008; Gerbner et al., 1980, 1994). These portrayals ultimately affect news consumers and shape the way they interact with persons of color and the world around them.

The Influence of Media Exposure on the Formation, Activation, and Application of Racial/Ethnic Stereotypes

Dana Mastro and Riva Tukachinsky

ABSTRACT

Although exposure to mass media content represents only one of a number of factors associated with the construction and application of racial/ethnic stereotypes, its influence should not be trivialized. Both theory and empirical research on media and stereotyping indicate that stereotypes arise from and are maintained via interaction with the messages offered in mass media fare – including exposure to both thematic messages as well as more uncommon messages stemming from idiosyncratic media use. Accordingly, to understand the role of the media in issues pertaining to stereotyping it is essential to consider: (a) how diverse groups are represented across the media landscape; (b) the manner in which exposure to these characterizations influences stereotype-based processes; and (c) the features of consumers and media messages themselves that may moderate stereotype-related outcomes. The present chapter highlights the existing research in each of these areas and offers suggestions for further study.

Media and Stereotypes

Exposure to mass media has long been identified as a factor contributing to the construction of social reality, including stereotypic views about the qualities seen as characteristic of different racial/ethnic groups (Gerbner, Gross, Morgan, Signorielli, & Shanahan, 2002; Mackie, Hamilton, Susskind, & Rosselli, 1996; Mastro, 2009a; Shrum, 2004). Of course, mass media represent only one of a number of determinants of stereotypes; nonetheless the role of the media in stereotype-based processes should not be trivialized. Based on the empirical research in this domain, it is clear that stereotypic notions arise from and are maintained by audience members' interactions with both the persistent themes in mass media content as well as the more unique and/or uncommon messages stemming from idiosyncratic usage patterns (see Mastro, 2009a, for review). As such, any examination of the media's role in issues pertaining to media and stereotyping must consider: (a) the manner in which racial/ethnic groups are depicted in the media, (b) how exposure to these portrayals contributes to the formation, activation, and application of racial/ethnic cognitions, and (c) the characteristics of consumers and media messages that moderate stereotype-related outcomes. To this end, the present chapter highlights the work in each of these areas.

Portrayals of Race/Ethnicity in the Media

The effects of media use on stereotyping reflect, in part, the race-related features of media content itself. Accordingly, any discussion concerning the influence of media exposure on stereotypes and stereotyping would be remiss without taking into account the nature of racial/ethnic characterizations in the media. Given that the content analytic work in this area has been comprehensively reviewed elsewhere (see Mastro, 2009b, for review), only a brief overview of racial/ethnic portrayals in US mass media will be offered here.

When it comes to sheer numeric representation on prime time television, in film, in magazines, and in commercial advertising, Whites and African Americans are depicted at rates that meet or exceed their proportion of the US population (Children Now, 2004; Covert & Dixon, 2008; Eschholz, Bufkin, & Long, 2002). The same cannot be said for Latinos, Asian Americans, Native Americans, and those of Middle Eastern and Asian Indian descent – all of whom are only infrequently seen in these traditional media venues, if at all. The rate at which different groups are depicted in the media is intrinsically meaningful as such visibility subtly communicates messages to consumers about the strength and status of different groups in society; reinforcing intergroup behaviors that privilege certain groups over others (Harwood & Roy, 2005). However, the specific features attributed to different racial/ethnic groups in mass media offerings

are of even greater import, as these messages contribute to viewers' cognitions about different groups (which may ultimately govern subsequent race-related responses).

In terms of the types of roles and representations associated with different groups, distinct pictures emerge based on the race/ethnicity of the character (Mastro, 2009b). Although it has taken over 50 years, African Americans on TV, in the movies, and in advertising enjoy a diversity of parts, representing a wide-range of backgrounds, experiences, and opportunities. They are commonly featured as primary characters in fictional, entertainment content, holding high-status and respected positions (although this is less the case in film than it is in television). News coverage of African Americans, however, provides an altogether different (and more unflattering) picture (Entman, 2006; Chapter 12). When depicted in news photographs, African Americans are seen most frequently in sports stories (Rodgers & Thorson, 2000). When coverage turns to politics, African Americans often fare poorly; with African American politicians presented as more demanding than their peers and characterized as striving to promote racial issues at the expense of public interest (Entman, 2006). The message is more egregious when it comes to coverage of crime in local news. Although the share of African American law-defenders (e.g., police officers) is consistent with their prevalence in society, they are over represented as lawbreakers compared with both depictions of Whites as well as with real-world arrest reports (Dixon & Linz, 2000a). Further, this discrepancy increases when the victim in the crime story is White (Romer, Jamieson, & DeCoteau, 1998). In these news stories, African Americans are commonly portrayed in a threatening and disheveled manner; appearing nameless and restrained (Entman, 1992, 1994, 2006). These notions are mirrored in the picture presented by videogames, wherein African American characters are seen displaying physical and verbal aggression at higher rates than other racial/ethnic figures (Glaubke, Miller, Parker, & Espejo, 2001).

Looking at representations of Latinos reveals that in nearly all forms of media content, this group is depicted in a largely unfavorable manner. When seen on TV, in film, and in advertising, Latinos are typically found in minor roles or group settings. Compared to their counterparts in the media, Latinos are portrayed as less authoritative, lazier, less articulate, less intelligent, more sexualized, and more likely to be in a service position (Children Now, 2004; Mastro, 2009b). The images offered in the news are equally unflattering. Here, Latinos are depicted as criminals more frequently than Whites (Dixon & Linz, 2000a). Further, when it comes to representations as victims, Latinos are seen at a level below both their White, on-air counterparts in the news, and below real-world crime reports (Dixon & Linz, 2000b).

When Asian Americans are seen in entertainment programming and advertising, they are most commonly found in minor and non-recurring parts (Children Now, 2004, Mastro, 2009b). However, in these roles Asian Americans are often portrayed in high-status and professional positions such as physicians, journalists, and elected officials (Children Now, 2004). Still, their presence is commonly marked by their passive nature. The exception is in videogames where they appear at a level above their proportion of the US population; typically as fighting characters who are often antagonists (Glaubke,

Miller, Parker, & Espejo, 2001). In terms of visual depictions/photographs of Asian Americans in print media, they are most likely to be seen in stereotypical context such as in coverage of scientific and medical issues (Rodgers & Thorson, 2000).

Native Americans, Middle Easterners, and Asian Indians suffer an even more severe form of neglect from the media. Although several content analyses of television, film, and advertising report finding no Native Americans, when they have appeared they are characterized as spiritual, as warriors, as having social problems (e.g., alcoholism), or in historical contexts (Children Now, 2004; Fryberg, 2003; Merskin, 1998). Interviews with workers in news organizations echo the findings from content analyses of entertainment media. Journalists acknowledge that they are most likely to address Native Americans in news stories that revolve around crime or ethnic festivals (Heider, 2000). Turning to characters from the Middle East reveals that representations linked with criminality make up the lion's share of roles for this group (Children Now, 2004). For Asian Indians, depictions are tied to stereotypical notions about traditional ceremonial practices, occupations, and gender roles (Ramasubramanian, 2005). As a result of their scarcity in the media, little more is known about the manner in which these racial/ethnic groups are portrayed.

Although this summary highlights contemporary images of race/ethnicity in US media, it is important to note that many of the most unfavorable representations, produced in previous decades, remain a part of the media landscape through cable channels which focus on "classics" and Internet sites which offer streaming video of past and present television programming. Altogether, the significance of these images cannot be overstated as (alongside audience characteristics) they define the stereotypes that are formed and the effects that are produced based on exposure.

Stereotype Construction

Despite the fact that theories in the domain of media effects, social psychology, and cognitive psychology all implicate media messages in the construction of stereotypes (Hilton & von Hippel, 1996; Mackie et al., 1996; Mastro, 2009a), only a few empirical studies have addressed the media's role in such processes (and even these only do so tangentially). As such, the specific mechanisms underlying media-based processes of stereotype formation remain inadequately defined. Nonetheless, the insights offered by these theoretical frameworks suggest that media messages are likely to account for a meaningful part of individuals' perceptions about racial/ethnic groups.

Absent preexisting differences between groups, media messages can contribute to stereotype formation by directing attention to features of certain groups and not others (whether or not legitimate) that encourage category-based distinctions. In so doing, the explicit and implicit messages conveyed by the mass media supply audience members with sets of attributes to be associated with different groups (e.g., qualities, value systems, attitudes, behaviors, status, etc.). In other words, exposure to messages about race/ethnicity in the media's texts and images promotes the

development of media-formulated conceptualizations of racial/ethnic groups and race-related judgments. As such, media can be seen to provide the cognitive foundations for stereotype formation.

One of the most straightforward routes to stereotype formation based on media exposure stems from humans' natural, unconscious ability to detect covariation. As Hilton and von Hippel (1996, p. 245) explain,

once an initial contingency between two events has been detected nonconsciously, people behave as if the relationship continues to exist long after the contingency has been removed [...] because contingencies are easier to learn when they are associated with individuals with whom one has little experience rather than with individuals with whom one has a great deal of experience, nonconscious detection of covariation is likely to play a larger role in the development of stereotypes about out-groups rather than in-groups.

Simply put, linking certain sets of qualities with particular groups (and not others) can quickly lead to abstracting this relationship so that it exists outside the context of the exposure. Accordingly, once the association has been made, it can become self-perpetuating, even gaining in strength absent any supporting evidence. Thus, the development of stereotypic notions about racial/ethnic groups is effortlessly facilitated by repeated exposure to the media construction.

This assertion is likely to resonate with scholars of cultivation theory who have long asserted that consistent exposure to the repetitive system of messages presented in the mass media (regardless of the veracity of the content) shifts viewers' social perceptions toward the media version of reality, particularly when these messages do not compete with consumers' real-world experiences (Gerbner, Gross, Morgan, Signorielli, & Shanahan, 2002; Hawkins & Pingree, 1990; Chapters 2, 11, this volume). Given this, lower levels of real-world interracial contact would likely enhance the media's impact on stereotype formation. On the other hand, contact with minority group members who exhibit traits consistent with the stereotypes presented in the media also would yield especially pronounced effects (Shrum & Bischak, 2001). Put differently, the more the content of mass media overlaps with viewers' everyday lives the less likely these messages are to trigger scrutiny; thereby enhancing their influence on stereotype formation (Mastro, Behm-Morawitz, & Ortiz, 2007; Roskos-Ewoldsen, Davies, & Roskos-Ewoldsen, 2004).

Although not intended to address the cognitive underpinnings of stereotype creation, empirical evidence for these assertions can be (cautiously) gleaned from research examining cultivation effects based on exposure to particular genres/outlets of mass media. This work reveals that consumers' perceptions of different groups, indeed, come to mirror the media messages to which they are exposed. For example, audience members who are heavier consumers of television sitcoms (where African Americans enjoy roles as high status, successful professionals), hold more favorable beliefs about African Americans' real-world level of education and socioeconomic status (Armstrong, Neuendorf, & Brentar, 1992; Busselle & Crandall, 2002). On the other hand, those who are heavy viewers of dramatic programs (where African

Americans are more likely to be depicted in low-status positions) possess more unfavorable views regarding the educational achievement of African Americans (Busselle & Crandall, 2002). Individuals who consume elevated levels of news, both on television (Armstrong et al., 1992; Dixon, 2007) and in print (Vergeer, Lubbers, & Scheepers, 2000), report stereotypic views about African Americans' (and other racial/ethnic minority groups') unlawful and menacing nature. Additionally, research reveals that as the amount of exposure to Latinos in the media increases (moderated by contact and existing racial attitudes), so too do perceptions that Latinos are criminal, unintelligent, and lazy – reflective of the overarching characterizations of this group across media offerings (Mastro et al., 2007).

Research framed in the tradition of social cognitive theory (Bandura, 2002) additionally demonstrates the influence of media exposure on the acquisition of stereotypes about race/ethnicity. Rather than emphasizing repeated exposure to a consistent set of stereotypic messages (*à la* cultivation theory), social cognitive theory stresses the role of reinforcement in the process of learning from the media. For instance, television viewers can improve their attitudes towards out-group members by observing an in-group television character modeling positive and rewarding relationships with out-group characters (Ortiz & Harwood, 2007). Consistent with the research on cultivation theory, however, studies applying social cognitive theory focus more on stereotyping as an outcome than on how these mental constructs are formed. Nonetheless, results from this work provide further evidence in support of the assertion that exposure to media's messages about race/ethnicity contributes to the construction of stereotypes. Specifically this research finds that consuming negative characterizations of African Americans in the media leads to more unfavorable beliefs regarding African Americans' intelligence, work ethic, and socioeconomic status (Fujioka, 1999; Tan, Fujioka, & Tan, 2000). Similarly, exposure to unflattering portrayals of Native Americans produces more negative views of Native Americans, particularly in terms of socioeconomic status (Tan, Fujioka, & Lucht, 1997). Alternatively, exposure to positive messages about race/ethnicity in the media yields more favorable stereotypes about both African Americans (Fujioka, 1999) and Native Americans (Tan et al., 1997). The presumption here is that consumers evaluate the rewards associated with racial/ethnic characterizations (e.g., personal gain, enjoyment, social status) and if they are sufficiently confident in their ability to reproduce the modeled behavior (e.g., discriminating on the basis of race, or acting in an egalitarian fashion), then learning (and subsequent initiation) will be facilitated.

Taken together this body of research suggests that exposure to media messages provides the cognitive foundation for stereotype formation by offering the features that come to define different races/ethnicities. However, these stereotypic notions are additionally meaningful as they provide insights into the types of outcomes that can be expected as a result of exposure including straightforward stereotyping and discrimination as well as intergroup comparisons which ultimately serve group identity needs. Accordingly, the next question becomes, how does the activation of these constructs impact on subsequent effects?

Stereotype Activation and Application

Stereotypes can be defined as cognitive schemas organizing information about social groups. Regardless of their personal endorsement of the stereotype, all members of a given culture may still possess knowledge about the stereotype. Consequently, media exposure can make these cognitive structures more available (i.e., stereotype activation). Absent controlled inhibition processes, these media-activated stereotypes are likely to be applied; potentially provoking prejudicial responses (Devine, 2001). Priming research on stereotype activation and application addresses this relationship by tapping into a broad range of issues and outcomes.

In the current context priming refers to the process through which information about racial/ethnic groups that has been recently activated by exposure to the media, influences subsequent judgments regarding target minority groups (see Chapter 3 for priming in the context of political communication). Generally speaking, results from these investigations demonstrate that even a single exposure to racial/ethnic stereotypes in the media can influence: (a) majority group members' real-world racial/ethnic evaluations, (b) intergroup behaviors such as group enhancement, (c) political decision making, (d) minority group members' evaluations of self, and even (e) prosocial outcomes.

It is important to recognize that while the bulk of this research is focused on the harmful consequences associated with stereotypes, these constructs are not inherently negative. Instead, they can serve several important psychological functions such as facilitating the organized and efficient processing of information. Further they can aid in the enhancement of one's positive self-image. However, when they are utilized to support group-based distinctions which privilege certain groups at the expense of others, they become problematic. Not surprisingly, then, the majority of research has been devoted to the media's role in generating such antisocial outcomes.

Priming Real-World Racial/Ethnic Evaluations

Findings from such investigations indicate that even a single exposure to racial/ethnic stereotypes in the media can affect evaluations of minorities in the real world. For example, in their study assessing the effects of exposure to news depictions of race and crime on beliefs about African Americans, Johnson, Adams, Hall, and Ashburn (1997) found that alongside prompting stereotype-consistent responses, priming such depictions also provoked differential attributions for the behavior. Specifically, dispositional explanations (i.e., personality-based) were provided for African American perpetrators (particularly those implicated in violent crimes) whereas situational explanations were offered for White defendants. Consistent findings were yielded by Peffley, Shields, and Williams (1996) in their examination of the influence of race primes in crime news coverage on subsequent racial/ethnic judgments. Their data

revealed a significant association between the race of the depicted suspect and stereotypic evaluations. Similarly, results from Abraham and Oppiah's (2006) research on the influence of implicit racial cues in news stories on consumers' stereotype-based evaluations suggest that exposure to even subtle depictions of race/ethnicity (i.e., referencing topics stereotypically associated with specific social groups without explicitly mentioning race), can generate stereotypic responses in White consumers. The authors contend that this result illustrates a tendency for more pronounced priming effects to emerge when the depicted trait is stereotypically associated with the target.

Notably, priming effects can occur in individuals who do not endorse the stereotype themselves. Merely being part of a culture where knowledge of such constructions is common can be sufficient to evoke the stereotypic response (Devine, 2001). However, to the extent that the association between the group and its stereotypical attributes is strong, priming will be greater. Here, again, media play a vital role by strengthening such associations. Studies have consistently demonstrated that racial priming effects are more pronounced among heavy media consumers than among light ones. For instance, Dixon and Maddox (2005) compared light and heavy media users' responses to a news story featuring a White or a Black crime perpetrator. They found that in comparison to light television news viewers, heavy news consumers were more likely to experience emotional discomfort when reading a story about a Black rather than a White perpetrator. Similarly, heavy news consumers, but not light news viewers, had more positive evaluations of the victim when the perpetrator was Black rather than White. Accordingly, these results demonstrate that repeated exposure can make stereotypes chronically accessible, and therefore more likely to be applied in the future. In other words, whereas recently primed constructs are more available for use in processing and interpreting information, long-term exposure strengthens the cognitive associations between the attribute and the target. So, when exposed to news portrayals of African Americans in the context of crime, the effect of priming should be stronger among those who are heavy news consumers.

Moreover, activation of a single construct can create a cascade of activated, semantically-related constructs that spread through the entire network of stored representations (spreading activation, Jo & Berkowitz, 1994). Accordingly, although a prime might relate to only one aspect of a stereotype, it can bias a broader array of social judgments. Put differently, priming a particular construct in memory not only affects judgments related to that particular trait, but also activates a wide range of schema for the target; influencing a variety of judgments beyond that which was primed (Ford, 1997). For example, listening to violent rap music by Black artists triggers other domains of African American stereotypes, affecting perceptions of Blacks' intelligence and work-ethic (Johnson, Trawalter, & Dovidio, 2000). Further, Valentino's (1999) research indicates that certain topics, such as crime and poverty, have become implicitly linked with race in US society and, as such, media coverage of these issues prompts stereotype-based responses regarding both the activated construct and semantically associated constructs.

In addition, because stereotypes can be used to enhance effective, but not necessarily accurate, information processing, priming these constructs can lead to distorted retention of media information. Several studies have shown that activating racial stereotypes encourages news consumers to complete the missing information in ways that make a coherent, but stereotype-consistent, story. For example, Dixon (2007) varied the race of a police officer and criminal depicted in a television news story such that they were White, Black, or their race was not identified. After watching the news program, participants were asked about the race of the perpetrator and the police officer. When the race of the perpetrator and/or the police officer was not mentioned in the news story, viewers tended to provide information that was consistent with their racial stereotypes. That is, participants assumed that the police officer was White and believed that the criminal was African American. Similarly, Oliver, Jackson, Moses, and Dangerfield (2004) examined the ability of individuals to recall the facial features of persons depicted in various news stories. They found that after reading a crime news story about a violent crime (but not after reading a non-crime story), participants tended to believe that the individual in the picture accompanying the story possessed more Afrocentric than Eurocentric facial features. Here again, media consumers constructed their memory in a manner consistent with their existing racial stereotypes. From a processing perspective, this tendency makes retrieval and organization of information easier and less laborious. In terms of stereotyping and discrimination, however, this process yields outcomes that are entirely undesirable.

Intergroup Behaviors

In addition to serving such cognitive functions, priming stereotypes can also assist individuals in maintaining their positive self-image. According to social identity theory (Tajfel & Turner, 1986), this outcome is driven by social comparison processes wherein individuals manage their identity needs by positively distinguishing their in-group from less favorable out-groups. To this end, mass media contexts are considered particularly efficacious in that they can be easily manipulated to manage identity demands via selective exposure and even selective interpretation of content (Harwood & Roy, 2005). Of course majority group members are advantaged by a broader array of media options which provide a basis for auspicious intergroup comparisons: However, with additional effort the same benefits can be attained by minority group audiences (Abrams, Eveland, & Giles, 2003; Abrams & Giles, 2007).

Experimental tests of these assumptions in the context of television use have met with somewhat consistent support in application to majority group audience members' exposure to stereotypical minority group portrayals. This research reveals that viewing unfavorable depictions of minorities in the media can provoke negative, stereotypical responses among White viewers (particularly highly race-identified

Whites), which in turn, appear to augment self-concept by offering a social comparison that privileges their dominant group (Mastro, 2003). Further, when the content of the media offers protection from the threat of appearing racist (e.g., through ambiguous messages), in-group favoring behaviors seem to be enhanced (Mastro, Behm-Morawitz, & Kopacz, 2008). This is not to say that overtly prejudicial responses are unlikely to emerge based on media exposure (certainly the evidence reported here refutes that notion): However, the suggestion is that such outcomes may manifest even more so when media content offers protection from appearing racially biased.

Equally compelling evidence in support of the media's ability to subtly promote racial/ethnic antipathy can be found in Weisbuch, Pauker, and Ambady's (2009) examination of the influence of exposure to racially biased nonverbal facial expressions and body language in television programming on the implicit and explicit racial attitudes of viewers. Their results indicate that observing racial bias in nonverbal interracial interactions on television promotes pro-White attitudes, greater liking of White characters, and more prejudicial attitudes in general; despite the fact that these nonverbals go entirely unnoticed by the viewer.

Media use also has been linked to more nuanced intergroup responses involving differential usage of language. According to Semin and Fiedler (1988), speech parts vary in their level of abstractedness, with descriptive action verbs (e.g., "hit") being the most concrete and adjectives (e.g., "aggressive") the most abstract. This distinction is meaningful in that concrete language is seen to designate specific, possibly one-time acts (and thus, situational attributions), whereas abstract words suggest a more intrinsic and enduring characteristic of the perpetrator of the same behavior (and therefore, dispositional attributions). Notably, research assessing the influence of television exposure on such biases in language use (Gorham, 2006) demonstrates that consuming high quantities of television news (with its emphasis on African American criminality) predicts the use of abstract language (and dispositional evaluations) when describing out-group suspects (in this case, African Americans) and the use of concrete language (and situational evaluations) when characterizing in-group suspects (i.e., Whites). Gorham (2006) argues that these results are evidence of the fact that biased processing favoring one's in-group occurs without the conscious knowledge of the viewer.

Political Decision-Making

Assumptions based on media priming, alongside insights from theories of media socialization and policy reasoning, are all used to assess the influence of exposure to media depictions of race/ethnicity on political decision-making. Much of this research focuses on the impact of viewing depictions intersecting race and crime in the news on White audience members' voting decisions and judgments about policy issues (Mendelberg, 1997; Valentino, 1999). For example, in her experimental exami-

nation of the influence of exposure to news coverage of an incident in which a furloughed African American convict brutalized a White couple, Mendelberg (1997) found that, compared with those who were not exposed to the story, those who viewed the news story were more likely to be guided by their existing racial prejudice when making policy judgments. In particular, those who were shown the story reported greater resistance to government actions aimed at reducing racial discrimination in society.

Findings from Valentino's (1999) research examining the influence of exposure to crime-related television news on evaluations of presidential candidates yielded parallel results. His data indicate that support for Democratic candidates was particularly low on issues of crime and other race-coded topics (e.g., welfare) when audience members were exposed to minority perpetrators in the news stories (despite the fact that the content of the news stories was unrelated to the candidates). Under the same conditions, support for Republican candidates was especially high. Valentino (1999) argues that effects of this nature reflect the media's ability to activate existing perceptions of Democrats as weak on crime and sympathetic to minorities, resulting in negative evaluations. This assertion finds support in results obtained by Gilliam (1999) in his assessment of the influence of exposure to news stories featuring a "welfare queen" frame on consumers' views of African Americans. His findings indicate that exposure to such imagery increases negative evaluations of African Americans (as well as opposition to welfare spending) regardless of the welfare recipient's race.

Taking a different tack, both Tan, Fujioka, and Tan (2000) and Mastro and Kopacz (2006) looked at the influence of overall media exposure on attitudes about race/ethnicity and the implications of such perceptions on political decision-making. In each case, these researchers found that exposure to unfavorable characterizations of race/ethnicity in the media promoted more stereotypic evaluation of minorities in society (among White consumers) which, in turn, served to discourage support for race-related policies such as affirmative action.

Minority Group Members' Evaluations of Self

Of course majority group members are not the only audiences exposed to depictions of race/ethnicity in the media. Minority groups, too, are consumers of these messages. It is not surprising to note then, that minority audience members are critical of the unfavorable manner in which they are often featured in US media and see these portrayals as negative, inaccurate, and damaging to both their group identity and social status (Fujioka, 2005a, 2005b). Accordingly, for these groups, the selection of media requires more thoughtful and deliberate effort to protect self-concept (Harwood & Roy, 2005).

Yet, despite efforts to manage the potentially harmful effects of exposure to negative media images of one's group, research indicates that consuming these messages can nonetheless damage the self-concept and esteem of minority group audiences.

To illustrate, Fryberg's (2003) research examining the influence of exposure to Native American mascots (e.g., Chief Wahoo) on Native American audience members demonstrates that viewing these images has a negative impact on media consumers' personal and collective esteem. For example, exposure was found to be negatively associated with beliefs in the positive qualities held by the community. Comparable results can be seen in research looking at the effects of exposure to mainstream US media on Latino audiences. In particular, these findings reveal consumption to have a detrimental impact on Latinos' self-esteem along a number of dimensions, particularly among consumers high in ethnic identification and actively engaged in the content (Rivadeneyra, Ward, & Gordon, 2007).

However, in much the same fashion that exposure to negative portrayals of one's group can compromise viewers' esteem, positive minority role models can serve as a source of inspiration and self-enhancement for members of minority groups (Fisher-Keller, 1997). For example, viewing Oprah Winfrey has been found to increase African American high school students' confidence in having a bright future (Austin & Freeman, 1997).

Improving Attitudes Toward Minorities

Although little attention has been devoted to the potential for media to promote prosocial outcomes by improving White media consumers' views of ethnic minorities, research undeniably suggests that exposure to auspicious racial/ethnic messages positively influences consumers' race-based cognitions (Bodenhausen, Schwarz, Bless, & Wänke, 1995; Mastro & Tukachinsky, 2011; Power, Murphy, & Coover, 1996). In the main, this work demonstrates that activating positive media exemplars (e.g., specific models such as Oprah Winfrey or Jimmy Smits) and/or prototypes (e.g., generalized representations such as strong family values) associated with racial/ethnic minorities generates more favorable attitudes towards these groups as a whole as well as more sympathetic response to discrimination as a social problem.

Factors that Moderate the Effect of the Media on Stereotyping

Finally, it is important to highlight the consumer- and message-based attributes known to influence the race-based outcomes of media exposure documented above. Research demonstrates that these factors impact both the effects associated with media consumption as well as the interpretations of the media messages themselves. In particular, real-world contact, mediated intergroup contact, viewers' own racial identification, viewers' preexisting racial attitudes, and the typicality of the media characterization each serve as moderators of race-based media effects.

Real-World Contact

Intergroup contact theory (cf., Pettigrew, 1998) holds that direct interaction between members of different groups can improve intergroup perceptions. However, the nature of the contact experience is critical. Empirical research has shown that the impact of intergroup contact does not lie in mere contact alone, but in the warm and friendly feelings that are produced by it. In other words, being exposed to an out-group member is not sufficient to reduce stereotypes. Rather, individuals have to develop a friendship for the desired effect to occur. This assertion is founded in several theoretical assumptions. First, it is argued that, at least to some extent, individuals maintain negative views of out-group members due to a lack of access to positive information about the group. If this is the case, stereotypes can be reduced through positive shared experiences between groups; which may also serve to reduce people's uncertainty about the out-group and even provide stereotype-disconfirming information. Further, through direct, positive contact with out-group members, individuals become exposed to the intragroup diversity inherent to the group. This contact experience undermines stereotyping as it encourages individuals to abandon tendencies to view the group as entirely homogeneous.

Accordingly, environments that promote mutual understanding, support, and cooperation should be more effective than competitive contexts in producing favorable intergroup contact (Pettigrew, 1998). Certainly, media contexts have the potential to provide individuals with such positive contact experiences. Indeed, when these positive media-based encounters are offered, exposure yields more favorable emotional responses to the out-group and more constructive perceptions of the out-group in general. To illustrate, research by Schiappa, Gregg, and Hewes (2005) has shown that emotional engagement with gay characters on television results in more favorable perceptions of gays in general. Importantly, this effect was *not* moderated by real-life contact with gays, suggesting that media-based contact with out-group members can be equally effective for all viewers, regardless of their everyday experiences with the out-group. Furthermore, unlike priming effects, which dissolve quickly after exposure, the outcome produced by viewers' attachment to out-group characters is relatively long-lasting. Unfortunately, to our knowledge, the effect of such parasocial relationships with racial/ethnic minority characters has not been directly examined. Nonetheless, these results clearly point to the media's ability to promote more promising interracial outcomes, given exposure to the appropriate media message.

Mediated Intergroup Contact

According to social cognitive theory, individuals can acquire new behaviors through observation of the consequences associated with others' actions (Bandura, 2002). In this type of vicarious learning, instead of receiving direct feedback, people

emulate behaviors that they observe to be rewarded in others and avoid performing behaviors that they see are punished. Indeed, studies have shown that observational learning is prevalent regardless of the type of the model – an actual person, a media representation of a person, or even a cartoon character. However, one's relationship with the model plays a meaningful role in the process. Specifically, identification with a media model (e.g., feeling similar to him/her) enhances the learning effect.

Recently, research has begun to apply this line of thinking to issues pertaining to media and race. The assumption here is that if people more easily relate to characters they identify as similar to themselves (e.g., in-group members), then when those in-group characters engage in positive relationships with out-group members, viewers vicariously share the positive intergroup experience. From this perspective, stereotypes can be reduced by way of viewers' identification with the in-group (rather than the out-group) character. To examine this assertion, Ortiz and Harwood (2007) explored the effect of exposure to *Will & Grace* (a sitcom featuring a gay protagonist) on heterosexual viewers' perceptions of gays. Their results indicate that viewers' identification with a heterosexual character that engaged in a positive relationship with a gay protagonist predicted viewers' positive views of gays. In other words, mediated relationships with in-group characters who model positive intergroup interactions provide viewers with the vicarious intergroup contact needed to produce more favorable perceptions of the out-group in society. Once again, to our knowledge, no studies have looked specifically at modeling cross-racial/ethnic relationships; however there is a sound theoretical basis to assume that such an effect would hold for interracial perceptions as well.

Racial Identification

Social identity-based research suggests that as the importance of one's own racial-ethnic identification increases so too does the motivation to protect the status and interests of that group (Oakes, Haslam, & Turner 1994; Tajfel & Turner, 1986). Accordingly, for media consumers high in racial identification, exposure to stereotypes of out-group races/ethnicities promotes more unfavorable and stereotype-consistent judgments of those out-groups as well as more advantageous evaluations of in-group members; even boosting self-esteem under certain circumstances (Mastro, 2003; Mastro et al., 2008).

Prior Racial Attitudes

Despite what would seem to be an obvious link between consumers' existing racial attitudes and the influence of media exposure on racial/ethnic stereotypes, research

in this domain has met with inconsistent results. In some cases, findings indicate that existing racial attitudes moderate the relationship between exposure to media stereotypes and subsequent stereotypical judgments (Dixon, 2006; Peffley, Shields, & Williams, 1996). Specifically, as racial antipathy increases, exposure to racial/ethnic stereotypes in the media generates more unfavorable race-based evaluations. In other studies, however, evaluative judgments were unaltered by consumers' existing racial attitudes (Oliver & Fonash, 2002; Oliver, Jackson, Moses, & Dangerfield, 2004). This may suggest that although media have a reinforcing effect by enhancing viewers' pre-existing beliefs, racial and ethnic media portrayals also have a main effect on stereotyping, regardless of media consumers' prior dispositions.

Typicality of Media Representations

Despite the potential for positive outcomes revealed by research addressing exposure to favorable representations of race/ethnicity in the media, it is possible that the prosocial effects of such media depictions may be limited to prototypical representations. Because counterstereotypical exemplars may be seen as unrepresentative of the group, positive evaluations of a constructive media model might not generalize to the group as a whole. In such cases, subtyping may occur; allowing the counterstereotypical representation to be dismissed as an exception to the rule and not as evidence of stereotype incorrectness (Kunda & Oleson, 1997). Extreme counterstereotypes may in fact enhance rather than weaken the stereotype they attempt to refute. Conversely, information about a seemingly typical group member is more likely to be incorporated in the overall evaluation of the group. In line with this hypothesis, Bodenhausen et al. (1995) demonstrated that favorable and salient counterstereotypical media exemplars (i.e., Oprah Winfrey and Michael Jordan) positively affected viewers' racial perceptions; however this effect disappeared when the models were processed as atypical of their group. Similarly, Mastro and Tukachinsky (2011) found that exposure to prototypical, positive media representations of Latinos (i.e., strong family values) but not exposure to positive, non-prototypical depictions was positively associated with Whites' favorable perceptions of Latinos in the United States.

Typicality of positive media models also constitutes a significant factor in promoting prosocial effects on minority media consumers. For example, Aronson, Jannone, McGlonean, and Johnson-Campbell (2009) hypothesized that exposure to declarations regarding the first African American nominee for US president would provide African American students with a buffer against stereotype threat. However, priming test takers with Barack Obama did not bridge the performance gap between White and African American test takers. The authors speculated that Obama was perceived to be atypical of African Americans as a group, diminishing the potential for his successes to generalize to their own.

Summary and Conclusions

As the evidence presented here clearly illustrates, the quality and quantity of media representations of race/ethnicity have significant social implications for both majority and minority group consumers. Along with the attributes of audience members, these media features create a shared version of what race/ethnicity represents in society; provoking a wide range of race-based outcomes related to both self and other. Of course, media are not solely responsible for the construction and application of stereotypes in society; however, it is difficult to deny that stereotypical media images of race/ethnicity play a meaningful role in shaping and maintaining the public's racial/ethnic cognitions.

Still, the outlook is not all bad – research shows that the media's impact is not limited to socially undesirable effects. Although stereotypes are difficult to change, exposure to favorable racial/ethnic media representations does have a positive impact, at least among certain media consumers. Thus, given the potential for media use to produce both positive and negative effects, the consequences of exposure and the mechanisms underlying such effects should remain on the agenda of contemporary media scholarship. To this end, a number of questions require more thorough attention.

First, further research is needed in exploring the role of media in the formation of stereotypes across the lifespan of the consumer. Perhaps because of pragmatic considerations, most of the research in this domain, both experimental and correlational, is limited to “one-shot” studies of adult audiences. Although these studies provide important insights into issues ranging from the activation and accessibility of stereotypes to the relationships between patterns of media use and existing attitudes, research is less informative when it comes to elucidating the specific mechanisms underlying initial stereotype formation. Accordingly, future studies should undertake the challenge of following media consumers over extended periods of time and exploring the long-term consequences of media exposure, beyond immediate priming effects.

Second, outside the lab setting people expose themselves to enormous amounts of media messages on a daily basis. Thus, the ecological validity of the research in this area would benefit from attempts to understand how exposure to a diversity of (possibly competing) messages impacts consumers. For example, what is the upshot of exposure to *both* positive and negative racial/ethnic media representations? Which messages win out and why? In addressing such questions, researchers could tap into notions rooted in the drench hypothesis (Greenberg, 1988); identifying specific media texts that, perhaps, have an impact above and beyond the effects of other media representations. In this way, it would be possible to investigate, for example, whether or not a parasocial relationship with a counterstereotypical African American protagonist on a single television show can override the negative effect of exposure to multiple representations of African Americans as criminals on local television news.

Last, because stereotypes are defined by both mediated and real-world experiences (Mackie et al., 1996), greater efforts aimed at disentangling the sources of these mental constructs may be of benefit in limiting their undesired effects. For example, it may be the case that stereotypes founded in media exposure have different consequences and routes to change than those derived from real-world exposure. If so, understanding the basis of these stereotypes and their subsequent influence on judgments is critical. Although this would certainly be a difficult task, such insights may open the door to altering and even eliminating the negative outcomes associated with stereotypes (e.g., prejudice) and augmenting the positive functions of these constructs (e.g., simplified information processing).

The Relationship between the Media, the Military, and the Public

Examining the Stories Told and Public Opinion

Michel M. Haigh

ABSTRACT

The media play an important role in times of conflict. How the media tell the story influences the public. This chapter discusses the relationship between the media, the military, and the public. Topics examined include the historical relations between the press and the military, the impact of embedded reporters during the war in Iraq, how visual images of war impact public support for the war, how media coverage impacts public opinion, and how nontraditional forms of media such as late night comedy and military blogs impact the public's knowledge and attitudes.

Media and War

The media play an important role in times of conflict. The stories, photos, blogs, and jokes used to discuss the war may influence the knowledge the public has about war, their attitudes toward war, and their opinion about war. One recent example is when the Bush administration blamed the media for eroding public support of the Iraq War. When the Iraq War started in 2003, more than 70% of US citizens supported

it (Benedetto, 2003). By June 2007, 70% of US citizens opposed the Iraq War (<http://politicalticker.blogs.cnn.com>). Bush stated the stories about Iraq were negative and failed to depict progress (Cloud, 2005), and this negativity led to a decline in public support.

The relationship between the press and the military can be turbulent. The public relies on the media to ask the tough questions needed to gain information about war in order to make up its mind about war (Aday, Livingston, & Herbert, 2005). However, research shows war coverage by the media is largely uncritical and often patriotic (Kellner, 1992; Newhagen, 1994; Pyle, 1979). When the press acts as a cheerleader, confidence in the press does not decline (Gross, Aday, & Brewer, 2002; Pew Research Center, 2003). During the first Gulf War, “media generally reacted with predictable boosterism” (Mueller, 1994, p. 74) instead of asking the difficult questions.

Previous academic research says military casualties drive public support for war (Mueller, 1973, 1994). The casualty intolerance hypothesis suggests US citizens generally don’t support war if there are large numbers of casualties (Larson, 1996; Mueller, 1994). Public support decreases as casualties increase (Larson, 1996), but if the government can say the operation is important, the public may support the losses (Feaver & Gelpi, 2004). Hansen, Haigh, and Pfau (2006) found for every 250 US military casualties in Iraq, the tone of television news coverage was about 14% more positive, confirming Mueller’s (1994) hypothesis that the media tend to be cheerleaders for the military and do not want to concentrate on the negatives of war.

There are very few media effects studies examining the relationship between war stories and their impact on the public. This chapter provides an overview of the military/press relationship, explains how the story of the Iraq War was told through the use of embedded reporters, examines the impact of visual images on support for war, and reviews the ways in which the press impacts public opinion.

The Press/Military Relationship

The press/military relationship dates back to the Civil War. The goals of the military and the press often conflict. The military wants the press to tell stories that build support for the war and its credibility (Paul & Kim, 2004); whereas, the media want to tell an accurate account of the military operations. One prominent example of a press/military conflict surfaced regarding the Vietnam War. US citizens watching the news received a mixed message about Vietnam because the military and the administration painted an optimistic picture of the war whereas the press often contradicted official accounts (Paul & Kim, 2004). Reporters were flown to a combat unit, saw the combat operations, wrote their stories, and then returned to their hotels. They would then attend the official military press briefing also known as the “five o’clock follies” (Rid, 2007). Reporters called the briefings the “follies” because the information at the briefing was sanitized, and the briefings did not paint the picture the journalists witnessed

first-hand (Rid, 2007). Military officials tried to make the bad news good but as support for the war eroded it became clear the military was not always successful. One explanation, therefore, for the tendency for the news media to provide positively framed, patriotic stories from the warfront is that such coverage is at least in part a result of attempts on the part of the military to control that coverage.

During the Gulf War, reporters had no eyewitness accounts of the war efforts (Brightman, 2003). The military controlled what reporters saw and read the reporters' stories before sending those stories to news agencies in the United States because they were trying to ensure the safety of journalists and the security of the mission (Paul & Kim, 2004).

After the Gulf War, members of the military and the media worked together to develop the Department of Defense (DoD) Principles for News Media Coverage of DoD Operations. The principles state (1) press pools will only be used during the early part of the war or when logistical constraints are present in that it might be too dangerous or hard for the media to maneuver; (2) The military would provide escorts and transportation when possible; (3) Reporters assigned to cover the war would have experience, have access to military units other than special operations, and be independent in their reporting (Paul & Kim, 2004). A group of military and media officials met in January of 2002 to develop the embedded press system used during the war in Iraq (Paul & Kim, 2004). The embedded system was a significant shift in military-press relations.

Embedded Reporters

The embedded system used during the war in Iraq was, in many ways, more successful than the press pools used in the past. This type of system "embedded" members of the press with units of the military. Being embedded is defined as "living, eating, moving in combat with the unit that [the journalist is] attached to" (Department of Defense [DoD] News Transcript, 2003, p. 2). The embedded press system allowed reporters to "have free access to military personnel at all levels; report general information about troop strength, casualties, and captured enemy forces; report information and location of military targets and objectives previously under attack; and report names and hometowns of service members with their consent" (Paul & Kim, 2004, p. 53). Due to the nature of the embedded system, it cost the news outlets around \$100 million to take part in the embed program (Harper, 2003). More than 2,200 reporters and camera crews covered the Iraq War. About 1,400 of those reporters were unilateral (nonembedded). There were more than 600 US and foreign journalists embedded during the beginning of the war (McClane, 2004; Paul & Kim, 2004).

Unfortunately, there are no media effects studies examining how stories told by an embedded or nonembedded reporter impact public support for the war in Iraq. Yet, there is a significant amount of research claiming there are differences in how

the story was told based on reporter status (embedded or nonembedded) (e.g., Pfau et al., 2004, 2005a, 2005b). Pfau and his colleagues (2004, 2005a, 2005b) and Haigh and her colleagues (2006) examined the impact of embeds on print and broadcast coverage. These findings are explored here to provide a better understanding of why the effect studies are needed and also to provide insight into how the Iraq story was told.

Pfau and his colleagues (2004) found embedded print reporters use more episodic frames [case study or event-oriented news report, offering concrete instances (Iyengar, 1991)]. In addition, embedded journalists tell more positive stories about the military and depict the military in a more positive light compared to unilateral reporters or reporters with an unknown status. Pfau and colleagues (2004) found during the first five days of the Iraq War, the coverage was more positive compared to the first five days of operation "Enduring Freedom" (the war in Afghanistan starting October 7, 2001), but not as positive as the first five days of the first Gulf War. Consistent with the above study, Pfau and colleagues (2005a) also found television news reports by embedded reporters during the first five days of the Iraq War were more positive in tone and in depiction of the military and employed more episodic frames compared to reports from nonembedded reporters. Thus, the use of embeds in the Iraq War appears to lead to more positive coverage during the start of the war.

If embeds were likely to report more positively on the war, news stories about the war in Iraq would differ after the invasion phase was over because the number of embeds had declined. Pfau and colleagues (2005b) and Haigh and colleagues (2006) compared the first five days of the invasion phase of the war in Iraq to five days of coverage in November 2004, almost nine months after the war started. Specifically, Pfau and colleagues (2005b) examined differences in broadcast news coverage. Embedded reports were more favorable toward the military, more positive in tone and depiction of the military, and more committed to the military's goals. The coverage during the first five days of the invasion phase of the war in Iraq was more positive than the coverage in November. Haigh and colleagues (2006) found print stories by embeds were more favorable toward the military and conveyed greater trust in the military. Print stories by embedded reporters were also deemed more credible by coders than stories from nonembedded reporters. Yet, in the Haigh et al. (2006) study of print news, there were no differences in these variables between the invasion phase and the occupation phase unlike in the broadcast stories in the Pfau et al. study (2005b). Thus, the possibility that the number of embeds shapes coverage at different phases of the war remains unclear.

Perhaps due to the difference in the reporting styles, there are some (Bucy, 2003; Ewers, 2003; Gralnick, 2003; Kalb, 2003) who question how embedding impacts the objectivity of the stories. Does the press act like cheerleaders as they have in the past, or perhaps even more so? Fox and Park (2006) examined CNN's coverage at the beginning of the Iraq War. They found nonembedded reporters to be more likely to use "we" or a form of it when telling a story than embedded reporters. Embedded reporters referred to themselves and the troops when telling the story, placing themselves as characters in the story. Embedded reporters used first-person singular nouns

more frequently than nonembedded reporters. However, Fox and Park (2006) did not find the objectivity of the story was impacted by the reporter using “I” or “we.” From these changes in language employed, therefore, it seems embedding reporters leads to a sense of community and greater connection between reporters and troops that may be reflected in the reporters’ coverage.

Older reporters with more experience have been found to be more positive about the embed experience (Fahmy & Johnson, 2007). Two-thirds of the journalist respondents in this study agreed their stories provided a fragmented view of the war; but also said their reports were fair. Unilateral or nonembedded reporters reported being able to pursue more stories and interact more freely with the Iraqi people, but had limited access to members of the military. The differences in access to military or Iraqi people impact how the story was told, according to the respondents. The reporters thought it was the editor’s job to take the reports and combine them for a complete picture.

It is important to understand how reporters’ status impacts the story told about the Iraq War because the type of story may impact support for the war. When people were supporting the war, the number of embeds was at its peak and the coverage was more positive in tone. Thus, the next direction in research should examine how reports from embedded or nonembedded reporters impact support for the war. The previous research explains how the use of embeds changed the way the Iraq War story was told and how the reporters felt they did telling the story, but the missing link is the audience’s perception of the use of embedded reporters. Future inquiries should address this critical topic.

Visual Images of War

Television has become the main source of information about war (Rid, 2007). There have been a number of books written about how television has been used to tell the war story (e.g., Hoskins, 2004; Morrison, 1992; Taylor, 1998). The consistent conclusion is that television has the power to influence public support for/against the war. One powerful aspect of war is the visual image. Images may show military casualties, which are defined as “any person who is lost to the organization by having been declared dead, missing, ill, injured, or duty status-whereabouts unknown” (<http://www.encyclopedia.com/doc/1O63-casualty.html>). There are limited studies examining the impact of war images on attitudes toward the war, but before these studies are examined it is important to understand what war visuals the public sees in the media.

Some scholarly research finds limited visual coverage of casualties for the Iraq War (Aday, 2005; Griffin, 2004; King & Lester, 2005). Silcock, Schwalbe, and Keith (2008) examined more than 2,500 images of casualties appearing on US television,

in US newspapers, news magazines, and online news sites during the first five weeks of the war in Iraq. They found across media types only 10% of images included a dead or injured person (casualty). They did not find any images of dead or injured Iraqi troops. 15% of the images shown on television during the first five weeks of the war depicted casualties.

It is assumed public opinion is influenced by the visual images of combat operations (Gartner & Secura, 1998). Some believe images of war have the power to sway public opinion for or against combat operations (Perlmutter, 1999). During World War II, President Franklin Roosevelt imposed a ban on photographs of casualties but later relented saying the photos could galvanize support for the war (Perlmutter, 1999). Presidents Jimmy Carter and Ronald Reagan were photographed at ceremonies honoring those that fell during conflicts in Pakistan, Beirut, San Salvador, and the Persian Gulf. During the Gulf War, President George H. W. Bush banned photos showing the remains of dead soldiers arriving at Dover Air Force Base after several television networks showed him giving a press briefing, while the other side of the split screen depicted coffins arriving at Dover (Milbank, 2003). President Bill Clinton lifted the ban only to have it reinstituted by President George W. Bush (Milbank, 2003). President Barack Obama and Secretary of Defense Robert Gates lifted the ban in favor of having the families decide on a case-by-case basis if the photos should be taken (National Press Photographers Association, 2009). The photos from Dover are often referred to as "The Dover Test." It is the assumption that witnessing military coffins delivered to the Dover air base influences public support for the war (Penrod, 2004). Senator John Glenn asked, "Will public opinion and will support in the Congress still be there when the body bags or coffins start coming back through Dover, Delaware?" (Penrod, 2004, p. 7).

The possible influence of more or less sanitization in news coverage of war is severely understudied. Domke, Spratt, and Perlmutter (2002) state, "systematic investigations of the [...] influence of visual news images are rare" (p. 194). Perlmutter (2005) calls for systematic study of "the actual influences of visual images on foreign affairs" (p. 111). In a rare example of both a content study and a related effects study, Sherr-Pollard (2001) performed a content analysis of news photographs and then conducted an experiment assessing emotional impact of news images. The content analysis showed photographs depicting violence were rare, and these photographs elicited negative affect in the experiment.

Pfau and colleagues (2006, 2008) also provide evidence for how visuals impact attitudes and emotions about the war in Iraq. Pfau and colleagues (2008) compare the impact of network television news reports of combat operations of the Iraq War (with and without graphic combat footage) on viewers. Pfau and colleagues (2008) found broadcast news stories showing visual footage of combat did not elicit greater emotional responses than the same story packaged as a "reader" (meaning, without visuals). However, participants who viewed television news stories showing visual footage of combat had less pride in the US military than those watching a "reader."

Pfau and colleagues (2008) found television news stories accompanied by visual footage influenced attitudes toward the war in Iraq. Broadcast stories with visual footage of combat undermined viewers' attitudes about continued US military presence in Iraq (Pfau et al., 2008). 70% of the stories about the war in Iraq in late 2005 discussed setbacks or obstacles to success in Iraq, and more stories were focusing on US casualties (30%) (Noyes, 2005). This coverage corresponds with a decline in public support for the war (Milbank & Deane, 2005). Pfau and colleagues (2008) state the results of their study indicate "television news stories featuring visual footage of combat reduced viewers' pride about US military presence in Iraq, enhanced their involvement levels about the war, and reduced viewers' support for continued US military presence in Iraq" (p. 318).

Similar results are found when examining print stories and photos of casualties. Pfau and colleagues (2006) examined print photographs of the Iraq War and the ways in which these photos may impact public support for the war. They compared a number of different ways to package the news story (e.g., photo plus caption, full-text story with no photo, or a full-text story with a photo and a caption). Findings indicate print photographs of casualties caused emotional responses in readers. News stories showing a photograph plus caption elicited more negative emotions (e.g., puzzlement, anger, and sadness) than stories about casualties without a photo. Pfau et al.'s (2006) findings confirmed Sherr-Pollard's (2001) findings. Photographs depicting violence elicit negative emotions in readers.

Pfau et al. (2006) also found stories without photos and stories with a photo reduce readers' support for continued US military presence in Iraq. "As people encounter repetitions of the same visual images and/or additional complementary images, it is likely that effects would grow" (Pfau et al., 2006, p. 161). Pfau et al. (2006) found when print news stories (regardless of how they were presented) discussed the battle for Fallujah, this topic led to greater support for US military presence in Iraq, suggesting support for a war can be increased by discussing ongoing battles, which may depict progress in the war. Thus, the impact of not just one news story seen in isolation but a series of news stories seen through repeated news exposure to the war should be further examined in future research.

Public Opinion and War

The military blamed the press for losing the Vietnam War, and former President Bush blamed the media for losing support for the Iraq War. In the end, there is a debate over what really drives public opinion. When examining previous research, the argument for the "casualties hypothesis" is the most common (Burk, 1999). This hypothesis suggests US citizens do not want to get involved in international conflict when people die. Burk (1999) developed this idea based on Mueller's (1973) research stating public support for war is inversely related to cumulative casualties. Mueller (1973,

1994) examined the Korean and Vietnam conflicts as well as the Gulf War. This research consistently shows support for the war declines as the number of casualties increases. Larson (1996) also argues there is a cost-benefit calculation at play. The public decides to support the conflict if the objectives are clear and there is a high probability of success. Thus, there also has to be ongoing success and a victorious end for public support (Feaver & Gelpi, 2004).

Feaver and Gelpi (2004) propose communication moderates the public's reaction. "If policy makers can make the case that the operation is important, then we would expect the public to show a willingness to shoulder greater cost" (p. 146). If communication about the war "demonizes" the enemy, then support for the war increases (Feaver & Gelpi, 2004). Therefore, the characteristics of the news coverage of the war are important.

Marginal casualties accumulating at an increasing rate are critical in predicting the direction and magnitude of change in the level of opposition at home (Gartner & Segura, 1998). "Marginal" is defined as those casualties above and beyond what is experienced in normal operations. The term could encompass casualties resulting from a single catastrophic event or higher than the usual casualties suffered in an ordinary combat event. Mueller (1973) posits the log function of the amount of cumulative casualties alone swayed public opinion about the Korean and Vietnam wars. Other researchers disagree. According to Gartner and Segura (1998), it is the marginal casualties, not cumulative casualties that are important in determining support for a particular war. Gelpi, Feaver, and Reifler (2005–2006) see casualty tolerance depending on the decision of going to war (was it the right one?) and the expectations about winning. An additional complicating factor is that the US public cannot accurately estimate the cumulative casualty numbers (Berinsky & Druckman, 2007; Boettcher & Cobb, 2006). Support for the war depends on the frame of the story, political ideology and attitudes, as well as individual attitudes about casualties of war (Boettcher & Cobb, 2006).

Hansen, Haigh, and Pfau (2006) aligned public opinion polls about Iraq with a content analysis of media coverage. They found when the tone of the television news coverage is positive and the number of casualties increases, public support for the war declines less compared to when the television news coverage is negative in tone and the number of casualties increases. In the data, support for the war erodes with positive coverage but at a slower rate than when the coverage is negative, supporting Feaver and Gelpi's (2004) theory. When the tone of television coverage is positive it appears victory is possible so people continue to support the conflict. This effect was only found for television news and not for print news stories. Hansen et al. (2006) explain this difference by concluding newspaper readers have stronger attitudes about the war and are not as easily swayed by the news content (Wenmouth, Jr., Shapiro, & Cutbirth, 1982). Hansen et al. (2006) find when newspaper stories were more positive, the decline in support for the war lessens (significantly) compared to negative coverage. These findings were not found for television news.

Nontraditional Sources of Information

Late Night Comedy

The public relies on sources other than the mainstream media for news. Two sources linked to political knowledge are late night comedy shows (Chapter 21, this volume) and blogs (Chapter 23, this volume). Research examining late night comedy reveals a number of political implications between late night comedy viewing and perceptions of candidate image (e.g., Baumgartner & Morris, 2006; Young, 2004) and political behaviors (Moy, Xenos, & Hess, 2005a, 2005b; Pfau, Houston, & Semmler, 2005). The Pew Research Center (2004) found 39% of people between the ages of 30 and 49 report learning something by watching comedy or late night comedy shows.

Late night comedy provides information about what is going on in the world, but comedians are supposed to be funny even in times of trouble, such as during the Vietnam or Iraq Wars (Peterson, 2008). One example occurred on January 11, 1991 (George H. W. Bush's deadline for Iraqi troop withdrawal in the first Gulf War). Johnny Carson started his monologue with a joke about Doc Severinsen's coat and Delta Burke's salary dispute before discussing the impending war. However, times have changed. During the Iraq War, Jay Leno employed the opposite strategy by leading with jokes about the war and then working toward less meaningful topics (Peterson, 2008). Thus, comedians and program hosts differ in their tendencies toward directly oppositional jokes about war.

The Smothers Brothers or *Laugh-In* used comedy to take aim at the government during the Vietnam War, while Carson tended to either avoid the topic or tell "soft" jokes about it (Peterson, 2008). During the war in Iraq, Jay Leno, David Letterman, and other late night comics told more jokes about Saddam Hussein and the UN allies rather than discussing George W. Bush's plans to invade Iraq in March 2003 (Peterson, 2008).

Haigh and Heresco (2010) analyzed almost 1,000 late night jokes about Iraq told from March 19, 2003 to April 9, 2007. Results indicate late night comics (Jay Leno, David Letterman, and Conan O'Brien) told prowar jokes during the first week of the war and then more neutral jokes later. The comedians depicted the US government negatively from 2003 to 2005, and more positively in 2006. The hosts told the most positive jokes about Iraq in 2006 and 2007 compared to 2003 to 2005, but this could be because they were telling fewer jokes as the war progressed. Hosts told the most jokes about Iraq in 2003 (354 jokes). This number declined each year (202 jokes in 2004; 172 jokes in 2005; and 173 jokes in 2006).

There is the potential for these patterns in late night comedy joke-telling to have an impact on the audience. Young (2004) found humor that was mocking candidates made negative character traits more salient with some viewers. This same pattern may be found for jokes mocking US policy. Future media effects research should also examine the differences between network late night content and cable content.

Monologue jokes by Leno and Letterman may not have the same impact on viewers' political knowledge or political attitudes toward policies and candidates when compared to the skits on the *Daily Show*. Future media effects research could also examine if watching late night television comedy might impact political behaviors, such as having a discussion or contacting political representatives about war efforts. This type of finding would support Moy, Xenos and Hess' (2005a) research. They found a positive correlation between watching late night television comedy and political involvement and discussions.

Blogs

Since the war in Iraq started in 2003, individuals have received information about the war from broadcast stories, print stories, and blogs. The use of online forms of information about the war has led to the war in Iraq being called an "Internet war" (Berenger, 2005; Hewitt, 2005; Weideman, 2003). Research examines how stories about the war are framed on US news websites (Schwalbe, 2006), how coverage of the war varies between United States and international online sources (Dimitrova & Neznanski, 2006), and what celebrity blogs say about the war (Trammell, 2006).

Tom Ricks suggests "milblogs" blur the distance between the military and civilian worlds (Hewitt, 2003). Milblogs are blogs written by service members overseas, former service members, individuals supporting the military, or family members of those serving. The blogs discuss the military, news and information about events, policies, and procedures (blogworldexpo.com, 2009). The milblog phenomenon began with *Sergeant Stryker's Daily Briefing*, which was created when a service member became disappointed with mainstream media coverage of the terrorist attacks of September 11, 2001 (*The Mudville Gazette*, 2005). By October 2009, milblogging.com was tracking 2,500 milblogs (<http://www.milblogging.com>, 2009). Milbloggers do not replace the mainstream press but "cover the story of Captain Helberg and Charlie Company when the mainstream media won't; and they will cover it in a way – with the kind of empathy born of shared experience – that the mainstream press can't" (McLeary, 2008, p. 40).

A study by Haigh and colleagues (2007) examined what milblogs discuss and whether milblogs influence people's attitudes about the war in Iraq more so than online news stories. Results indicate almost half (47.8%) of milblogs analyzed in the study discussed what was printed in the mainstream news (e.g., *USA Today*, *New York Times*, etc.). Diary-type posts discussed: other blogs, what the milblogger did that day, what the milbloggers' friends did, wounded or fallen soldiers, political figures, public support for the war, and special dates (e.g., celebrations of Mother's Day, Father's Day, or an anniversary). Less common topics discussed on milblogs included: Iraqi civilians, Iraqi forces, prisoner abuse, improvised explosive devices (IEDs), and the Iraqi constitution. More than half of the blog posts linked to outside information (e.g., other blogs, videos, photos, or news stories), and 13.4% included a photo.

According to the Haigh and colleagues (2007) study, milblogs tend to be neutral in their depiction of the military and typically use a neutral tone to discuss the topics much like a traditional news reporter would.

Haigh et al. (2007) sought to determine whether milblogs, compared to online news stories, exert different effects on perceptions of credibility and attitudes toward the US war in Iraq. Experimental results show participants' attitudes toward the war and perceptions of source credibility (online news source or milblogger) did not differ based on the where the story appeared. Milblogs were considered by participants to be the most credible source to discuss IEDs, whereas online news stories were deemed more credible when discussing the Iraqi constitution or training Iraqi forces.

Milblogs could have the power to influence public opinion and public policies (Berenger, 2006; Schwab, 2007). However, Haigh et al. (2007) did not find milblogs impact attitudes more than online news stories. The topic of the story (training Iraqi forces, IEDs, Iraqi constitution) appears to impact individuals' attitudes, not the source of the story. As might be expected, attitudes tend to be more positive about the war when the stories individuals read indicate progress in Iraq (training Iraqi forces or ratifying the Iraqi constitution) (Haigh et al., 2007).

Haigh et al. (2007) did not find any differences in perceived credibility among the story sources (news story or milblog). Milblogs were deemed just as credible as online news stories in this study. This may be explained by the milbloggers being deemed "trustworthy" and "experts" because they are in the line of fire and have first-hand experience. This supports previous research (Goldsmith, Lafferty, & Newell, 2000) suggesting milbloggers can be trusted because they are experts on the topic, the same as the reporters reporting news stories. We can conclude, therefore, that milblogs as well as other forms of blogging and online news sources join more traditional sources in bringing aspects of the war home to the public.

Conclusion

It is important to understand the relationship between the military and the media because it impacts how the story is told and the information the public has on which to form attitudes about the war. One significant change in the press and the military relationship is the creation and use of embedded reporters to report from the warfront. Future research should examine how the use of embedded reporters impacts public opinion. There is an abundance of research examining the differences between embedded and nonembedded stories and how the journalists thought they did telling the story, but there is a lack of research examining if these different stories impact public opinion.

There is also a lack of research examining how visual images influence attitudes about war. Pfau and colleagues (2006, 2008) and Sherr-Pollard (2001) have examined how visuals impact attitudes but more research can be done in this area. Pfau and

colleagues (2006, 2008) used a sample of college students. Results might vary for audiences who watch more television news, read the paper more frequently, and have had more life experiences. College-aged students provide a good sample for experimental research, but it is worth investigating these results outside of a laboratory setting. Research has found the US media is very sanitized when showing visuals of casualties. It is worth exploring the differences in support for war for individuals outside the US who are presumably exposed to more graphic images of war. The military is very concerned about US public opinion, but these images may be influencing global public opinion. Scholars also need to start analyzing public opinion and media content simultaneously much like Hansen et al. (2006) did in their study.

This chapter touches on a number of topics, but the overall theme is the lack of media effects studies. There are a number of content analysis studies and studies aligning survey questions with media use habits, but overall there are few studies examining the effects of information on public support for the war. The literature used to discuss each topic in this chapter (embeds, visuals, blogs, late night comedy) could be expanded to include direct studies of media effects. Researchers still have a lot to learn about the impact media have on individuals' attitudes and support for war.

Understanding the Role of Cognition and Media in Body Image Disturbance and Weight Bias in Children, Adolescents, and Adults

Kim Bissell

ABSTRACT

This chapter explores the role of cognition and media as it relates to body image disturbances and weight bias in children, adolescents, and adults. Specifically, this chapter examines the multidimensional factors related to an individual's body image and further examines how these variables relate to prejudice or anti-fat bias against others. Exposure to thin-ideal media and related effects on an individual's self-perception are examined in the areas of self-discrepancy, body dissatisfaction, drive for thinness, and body self-esteem. This chapter further examines the relationship between media and obesity with a look at the role media potentially play in the development of overweight or obesity in children. Lastly, this chapter will synthesize work in the area of media, cognition, and body image from a theoretical perspective and offer suggestions for the direction of future research.

Media and Body Size and Shape

Younger children spend approximately 25% of their time awake watching television, exposing them to television characters and images that reinforce notions about the importance of thinness and attractiveness (Harrison, 2000b; Yamamiya, Cash, Mlnyk, Posavac, & Posavac, 2005). During this important developmental stage, children are said to form many of their attitudes, beliefs, and perceptions about their own body shape and size and that of others (Smolak, 2008). If preventative measures aren't taken to address body image issues in these populations, they will find themselves living a lifetime with a negative body image. The general conclusion among researchers is that exposure to thin-ideal imagery is related to greater body dissatisfaction, lower body self-esteem, body dysmorphic disorder, self-discrepancy, and self-objectification in people of all ages (Harrison & Cantor, 1997; Jordan, Smisson, Burkner, Joyner, & Czech, 2005; Richins, 1991; Tiggemann & Slater, 2004). This is one of several reasons the media are said to play such a crucial role in the overall development of an individual's body image (Bissell, 2004a, 2004b; Harrison, 2000a, 2001).

Despite the representation of the thin ideal in a mediated context, the recent increases in childhood and adult obesity suggest a mismatch. Rather than there being a middle ground in which an "average" adult or child would see himself or herself in the media, what is viewed represents an end of the body shape spectrum that is largely unattainable. More importantly, the presence of thin and attractive women and muscular men has led to increases in anti-fat bias (AFB) among children, adolescents, and adults (Wang, Brownell, & Wadden, 2004). Published studies indicate that understanding the complex factors related to weight bias and body dissatisfaction involve social, psychological, and even sociological variables (Grogan, 2008). Along these lines, it may be in understanding the cognitive disposition of children and adolescents that helps explain how or why these attitudes and beliefs about the self and others are formed. This chapter explores the role of cognition and media as it relates to body image disturbances and weight bias in children, adolescents, and adults. Specifically, this chapter examines the multidimensional factors related to an individual's body image on both ends of the spectrum and further examines how these variables relate to prejudice or anti-fat bias against others. Lastly, this chapter will synthesize work in the area of media, cognition, and body image from a theoretical perspective and offer suggestions for the direction of future research.

Relevant Background and Earlier Work in the Discipline

In the United States, as many as 10 million females and 1 million males fight a life and death battle with disordered eating. Forty-two percent of first to third grade girls

want to be thinner. 81% of 10-year-olds are afraid of being fat. Furthermore, 91% of women recently surveyed on a college campus had attempted to control their weight through dieting (ANAD, 2010). Since the 1960s, the number of diagnosed cases of an eating disorder such as anorexia or bulimia has doubled, and health and psychological practitioners are seeing increases in disordered eating among preadolescents, women older than 30, non-Whites, and men – all traditionally not considered at risk for an eating disorder (Woodside et al., 2001). While recent news coverage of health issues has focused predominantly on the increases in obesity, especially in children, specialists in disordered eating argue that the societal gap is continuing to increase between those who are killing themselves with too much food and those who are killing themselves because of a lack of food (Landro, 2004).

Studies in the area of body image distortion suggest the media are one of many potential variables related to increases in disordered eating, especially in college and adolescent females (Harrison, 2000b; Harrison & Cantor, 1997; Stice, Schupak-Neuberg, Shaw, & Stein, 1994). The media are often held partially responsible for young females' desire to be extraordinarily thin because of the number of media messages promoting the "thin ideal." Several studies over the last decade have examined this problem, looking at possible social, psychological, and biological correlates to the witnessed increases in disordered eating. More recent studies have also found body image distortion to be problematic for women and girls in countries including Canada (Gadalla & Piran, 2007), Brazil (Nunes, Barros, Anselmo Olinto, Camey, & Mari, 2003), Sweden (Sundquist, Qvist, Johansson, & Sundquist, 2003), and Qatar (Bener & Tewfik, 2006), and women of ethnicities such as Asian Americans (Phan & Tylka, 2006), African Americans (Lilenfeld, Jacobs, Woods, & Picot, 2008), and Hispanic women (Hrabosky & Grilo, 2007).

There's little argument that the media content women and girls are exposed to and pay most attention to contain repeated messages promoting the thin ideal (Garner, Garfinkel, Schwartz, & Thompson, 1980; Silverstein, Perdue, Peterson, & Kelly, 1986; Wiseman, Gray, Mosimann, & Ahrens, 1990). Content analyses of entertainment television, fashion magazines, and advertisements have confirmed that the body shape standard found in media has become thinner (see above citations), even though greater diversity in the body type represented on television is beginning to be seen. The presentation of ultrathin models in the media, and certainly the presentation of thin models at the exclusion of average or overweight models, enforces the notion that there is one acceptable body type for women (Kilbourne, 1999). At the simplest level, this mismatch between the ideal and actual self could be responsible for the development of an eating disorder or the development of trait characteristics related to disordered eating, including body dissatisfaction (Bissell, 2004a; Richins, 1991), drive for thinness (Bissell & Porterfield, 2006; Harrison & Cantor, 1997), or physique anxiety (Bissell & Porterfield, 2006; Jordan et al., 2005).

Numerous studies have determined that the self-esteem of adolescent girls plummets significantly as they transition into their developmental teenage years (12–18), and young girls are said to lose confidence, self-esteem, and independence at an early point in adolescence, largely because of harmful cultural messages and societal pressures

(Grogan, 2008; Kilbourne, 1999; Myers & Biocca, 1992; Pipher, 1994). During this critical developmental stage, girls may experience a loss of self-image and develop skewed attitudes about their competence and body image (Stice & Bearman, 2001; Stice, Killen, Hayward, & Taylor, 1999). This problem isn't specific to women though, as other studies have examined the relationship between these variables among men and boys and exposure to action/adventure films and action/adventure figures (Olivardia, Pope, Borowiecki, & Cohane, 2004; Pope, Olivardia, Gruber, & Borowiecki, 1999).

Sports Media Exposure and Sports Participation

Although it is clear that a number of factors – including media – influence young girls' propensity to develop an eating disorder, exposure to thinness-depicting (TDP) media has been shown to significantly predict the symptoms (Bissell & Porterfield, 2006). One question that remains unanswered is if children are exposed to media messages that tout the positive aspects of the body – like sports – is it possible the outcome might be different?

Bissell and Zhou (2004) examined entertainment and sports media exposure and four body image outcomes in college women. Exposure to the TDP media was the strongest predictor of negative body image outcomes, and sports media exposure was marginally related to more positive outcomes. However, when exposure to a specific type of sport was examined, different findings emerged. When respondents' exposure to sports identified as lean (gymnastics, ice skating, swimming, and diving) was examined, the findings suggest increased levels of all four body image outcomes: body dissatisfaction, drive-for-thinness, anorexia, and bulimia. Lean sports are those in which the body is often on display and that often require a smaller body mass index in order to be successful, whereby non-lean sports include sports where less of the body is on display and greater muscle mass will not necessarily be a detriment to overall performance (basketball, soccer). The fairly big limitation to the above findings is that exposure to women's sports on television is sporadic, infrequent, and difficult to measure. Findings from this study identify a need for the refinement of the sports media exposure scale because the results suggested that exposure to some types of sports media were related to more positive outcomes. The general findings from this study suggest that sports media exposure might be linked to more positive attitudes about the body, but that finding may be predicated on the type of sport to which women are exposed.

The research, although minimal, which has investigated the relationship between girls' self-esteem, body self-esteem, and sports participation indicates a positive correlation (Smolak, Murnen, & Ruble, 2000). During this time of emotional and physical maturation and uncertainty, there is reason to believe that girls who actively engage in sports will have higher self-esteem than their non-athletic peers, since sports participation affords girls the opportunity to develop physical competence and de-emphasize the importance of physical attractiveness as the greatest measure of

their self-esteem (Daniels & Leaper, 2006). In a sport environment, girls can learn the value of teamwork and community involvement, form meaningful friendships, and girls may feel more confident and comfortable with who they are. Sports participation may also act as a beneficial mediator between TDP media exposure and low self-esteem, reducing the chances that young girls will develop an eating disorder (Cate & Sugawara, 1986). As noted below, media use, especially television use, by adolescents is high, so if girls spend less time doing things like watching television and spend more time doing physical activities like playing sports, that involvement could serve as a factor that helps elevate a girl's self-esteem.

Although several studies have examined sports participation and disordered eating outcomes, most have not included media exposure as a factor. For elite and professional athletes, involvement in a sport at a highly competitive level consumes great amounts of time, but it is important not to discount the role of the media. Subsequently, it is argued that the media may still play a role in shaping girls' sense of self and sense of body self-esteem by presenting images representing "ideal beauty" and "ideal thinness," even in media directed toward younger audiences. Bissell (2004a, 2004b) with Porterfield (2006,) and with Birchall (2008) examined sports participation as a moderating variable in athletic samples ranging from adolescent girls, elite adolescent athletes, and collegiate athletes. The findings from these studies indicate that media exposure is indeed an important variable. In the one study, Bissell and Birchall (2008) surveyed eighty 8–18-year-old female athletes about their time spent playing sports, their sport type – lean or non-lean – media use, and body self-esteem. In terms of this sample's media use, participants' television viewing was found to be quite specific because they had such limited time with the media. Also important was participants' own sense of media influence on themselves, an attribute that suggests a good deal about their own emotional and psychological development and maturity. In this sample, it was found that the older athletes, between 14–18, were more likely to believe that television played an important and influential role in learning how to be a girl, and the differences between the older and younger girls' scores on this question were statistically significant.

Despite great participation in sports and athletics, adolescent athletes exposed to thin-ideal imagery had significantly higher levels of body image distortion (BID) than participants who were not exposed to as much thin-ideal TV. In a study with Division I collegiate athletes, Bissell and Porterfield's (2006) findings closely mirrored those from the study with adolescent athletes: Exposure to thin ideal television was a significant predictor of increased levels of body image disturbance (BID) – body dissatisfaction, drive for thinness, anorexia, and bulimia. Even though studies mentioned earlier have found higher incidences of BID in athletes classified as participants in "lean" sports, findings from this study indicated that it didn't matter what sport the participant played or how long the participant played the sport, dissatisfaction with body shape and size was high across the sample. This suggests that involvement in sport, while beneficial for younger girls, may serve as less of a buffer against other harmful variables such as media and peers as an individual grows and develops.

In another study with Division I collegiate athletes, Bissell (2004) found thin-ideal television exposure to be a significant predictor of four dimensions of disordered-eating symptomatology. In this study, sports media exposure was found to be related to decreased levels of BID; however, when a hierarchical regression model was run including exposure to other types of media, the relationship disappeared. This suggests sports media exposure may still be important in finding ways to combat negative body image, but additional research is needed to better understand that exposure. It is for this reason, and many others, that a more comprehensive picture of body image distortion should be developed.

In one of the seminal studies of the relationship between media and body image, Myers and Biocca (1992) found that women who watched even 30 minutes of television programming a day had greater body distortion than those who did not. Other studies examining entertainment media confirm these findings. Time spent with media is important, but the content exposed to is as important if not more so (Bissell & Birchall, 2008). Furthermore, what isn't known from some self-report measures is how much an individual is attending to the content. If the individual is sending text messages, surfing the Internet, or engaging in other activities, the effect of exposure might not be as great because the individual may not be engaging in the social comparison process. This opens the door for other theoretical explanations of the phenomenon, theories that explain specific use of the media and individual factors like cognitive processing styles. In addition to expanding the theoretical model, scholars more recently have concluded that a myriad of factors are relevant in better understanding the development of negative body image. While findings from earlier studies are important in better understanding the way individual, social, and mediated factors shape and influence the way women, girls, men, and boys come to think about their body shape and size, the thinking now is that those factors are more individualized. One key issue with earlier studies in mass communication and other disciplines is that they have often not been multidimensional and have excluded the consideration of other environments.

Broader Contextualization of Relevant Factors: Body Image and Individual, Social, and Mediated Factors

The pervasiveness of thin-ideal imagery in multiple forms of media suggests that most girls and women are going to be exposed to thousands of messages touting the rewards of being thin and being attractive. However, several experimental studies have found that women are not equally influenced by these media messages. Individual characteristics such as cognitive processing styles, weight or body mass index (BMI), overall self-esteem, self-consciousness, and a tendency toward social

comparison have been identified as relevant predictors (Fairburn, Shafran, & Cooper, 1999; Myers & Biocca, 1992) along with other individual, social, or mediated factors.

The development of poor body image or disordered eating behavioral patterns can be a product of the factors mentioned above alone or in combination. For example, Ricciardelli, McCabe, Holt, and Finemore (2003) examined what they called biopsychosocial factors relevant in predicting children's body image and body change strategies. They found that individual factors such as gender, age, race, and BMI were significant predictors of the examined outcome as well as social factors such as perceived pressure from parents, peers, and the media. Wang, Byrne, Kenardy, and Hills (2005) identified individual factors such as ethnicity and socioeconomic status as relevant predictors of body dissatisfaction in Australian children and adolescents, and Mikami, Hinshaw, Patterson, and Lee (2008) found some trait characteristics of ADD/ADHD to be relevant factors in disordered eating pathology in girls. Specifically, the authors found that what they called "baseline impulsivity symptoms" compared to symptoms such as inattention or hyperactivity best predicted disordered eating pathology.

As attention is turned to outside influences, factors such as an individual's home environment have been identified as strong predictors of disordered eating symptomatology (DE) in some individuals. For example, Canals, Sancho, and Arijia (2008) found that when DE was identified in one or more parents in a household, children in that household were at an increased risk for the development of DE behaviors.

In an attempt to gain a more comprehensive picture of body image among children, Bissell conducted a pre- and posttest within-subjects experiment with 200 first–eighth grade boys and girls in the fall of 2009. Results from this study indicate that cognitive and rational processing styles, household dieting behavior, the Children's Eating Attitudes Test, and exercise attitudes were all related to participant self-discrepancy (Bissell & Hays, 2011; Bissell & Parrott, 2010). In a diverse sample with roughly equal numbers of boys and girls in all seven grades, Bissell and Parrott (2010) found that children who scored higher on the rational processing scale, meaning they were more likely to think carefully about things, had lower levels of self-discrepancy when asked to identify their actual and ideal body shapes. This was found for boys and girls, although the coefficient was higher for boys in the sample. Experiential processors, meaning those more likely to use their gut reaction and be more instinctive, demonstrated higher levels of self-discrepancy, and this was also true for boys and girls in the sample, although the R^2 was higher for girls than it was boys. This statistically significant relationship was found at the pre- and posttests across the sample.

Household dieting behavior also proved to be a relevant predictor of self-discrepancy in the same study, but this was only found for girls at the pretest. The household dieting scale measured the amount of discussion and behavior related to dieting in the participant's home. Results from the pretest indicate that in households where dieting and weight were frequently discussed or in households where the mother was frequently dieting, self-discrepancy was significantly higher.

Theoretical Perspectives

The complex relationship between media and body image distortion in women and girls has been examined using several theoretical frameworks: social comparison theory (Festinger, 1954), social cognitive theory (Bandura & Wood, 1989; Cash & Pruzinsky, 2004), self-discrepancy theory (Bessenoff, 2006; Higgins, 1987), cultivation theory (Gerbner & Gross, 1974; Levine & Smolak, 1996; Myers & Biocca, 1992; Tiggemann, 2005), and objectification theory (Bissell & Zhou, 2004; Cash & Pruzinsky, 2004; Fredrickson & Roberts, 1997; Slater & Tiggemann, 2002). Festinger's groundbreaking work in social comparison has led to a body of work using the theory as one possible explanation of body image disturbance. Festinger's belief that individuals frequently compare themselves to others on a variety of dimensions, including physical attractiveness and appearance, has supported a line of work examining individuals' comparisons between ideal others found in the media and themselves. Self-discrepancy theory is similar in concept in that the theory suggests individuals compare themselves to internalized standards, which are referred to as self-guides. The underlying premise of self-discrepancy theory is that discrepancies between the actual, ideal, and "ought" selves will result in emotional vulnerabilities, and in the context of studying body image distortion, these discrepancies may lead to outcomes such as body dissatisfaction, drive for thinness, or related outcomes. Both of the above theories help us better understand the role of the individual in the development of BID, whereas theories such as cultivation or social cognitive theory help explain the role of social or mediated factors.

In its simplest form, social cognitive theory (Bandura, 1989) suggests that individuals learn via observation of others around them. Social cognitive theory could easily be linked to the underlying premise of cultivation theory, as both predict the ways an individual might come to model behavior, beliefs, and attitudes related to body image, especially after increased time spent viewing television. Cultivation theory can be used to explain the way initial impressions of a body image norm might be developed, as Gerbner and Gross (1974) proposed that individuals who spend more time viewing television will have perceptions about the real world that more closely resemble the world presented to them in a mediated context. This theory could be expanded to consider perceptions about body image and appearance norms because of earlier findings about the narrow presentation of ideal beauty and ideal body shape often found in entertainment media. Fredrickson and Roberts (1997) offer objectification theory as a possible explanation of how and possibly why women and girls may respond to mediated messages via harmful attitudes or behavior as the theory suggests women, or more specifically the female body, is placed in a social context as an object rather than a subject. Objectification theory offers us a theoretical lens for understanding how a female might be led to view herself, based on female representations often found in the media.

One rather ironic factor about the media is that they can serve both a positive and a negative role in the development of a young girl's sense of self, especially as it relates to body image, creating incongruencies that make it confusing and complicated for viewers. As young girls look to television and movie stars such as Miley Cyrus (*Hannah Montana*) or Ashley Tisdale (*High School Musical*), they see glamorized images, which are, to a large degree, of very thin girls. Cultivation theorists would argue that repeated exposure to these thin-ideal portrayals will lead to distorted body perceptions, just as it does for college-aged and older women, due to television's ability to shape perceptions of social reality (Chapter 2). Many scholars examining the development of distorted body image in men and women suggest that it is the repeated viewing over time of similar content that contributes to an individual's beliefs about social reality (Tiggemann, 2005).

Despite the growing waistlines of children and adults nationwide, the representation of the body remains fairly narrow; yet, obesity has been a societal problem for decades. The question then arises, why is it that media representations of body shape have remained relatively narrow where children and adults have become increasingly larger? More importantly, what type of effect is seen when mediated representations of body shape do not mirror reality?

Other Body Image Outcomes: Anti-Fat Bias and Obesity

Nearly one in three children in the United States is overweight or obese, including youths, from 2-year-old preschoolers to 18-year-old high school seniors, and children of every race, ethnicity, and gender. Recent estimates show weight issues among children and adolescents remain a top health concern for the nation (Hedley et al., 2004). One question that merits attention from this array of stakeholders deals with the social and cognitive ramifications of obesity. Several studies have examined the convergence of increasing obesity rates and the psychosocial effects on children's perceptions of weight in themselves and others, but surprisingly little attention is given to the variety of factors that are relevant in the formation of negative attitudes about overweight and obese individuals.

The increased public and media attention to the problem has led to what Wang, Brownell, and Wadden (2004) call the "stigma of obesity" (p. 1333). They argue that unlike bias against minority groups, bias or negative attitudes towards overweight individuals is accepted and sometimes encouraged. Social marginalization and the stigmatization of obesity in adults have been well documented as resulting in disadvantages in employment, education, healthcare, and interpersonal relationships (Puhl & Latner, 2007). For example, McEvoy (1994) found in her study of employment discrimination against the overweight that the more overweight the employee,

the more likely he or she was to be discriminated against in the workplace. Puhl and Brownell (2001) found that obese individuals reported being discriminated against in public settings like grocery stores or restaurants. However, anti-fat bias and weight stigmatization are not confined to adults, as a growing body of research indicates that children may also be victims – and perpetrators – of anti-fat bias and weight stigmatization. While the existence and consequences of anti-fat bias have been documented, what remains unknown is how or when these biases or stereotypes about weight and obesity are formed in children.

The Role of the Media in the Development of Anti-Fat Bias

Decades of research on the media's influence on appearance norms and ideals shows that increased exposure to media, especially thin-ideal media, is related to a cultivation of perceptions about standards of beauty and thinness for the self and others. This type of exposure coupled with negative mediated representations of obese or overweight people may create or reinforce ideas about weight bias, especially in children. Certainly, the media may develop and nurture anti-fat bias (AFB) through the way television, magazines, and other sources present – or do not present – content. For example, a study by Latner and Stunkard (2003) found that children's media use, including magazines and videogames, was related to more negative attitudes toward obese youths. Television portrayals may be particularly problematic. Studies by Fouts and colleagues (2000, 2002) found that overweight characters are more likely to be the target of negative comments in television sitcoms. Negative comments also were backed by audience applause, which reinforced the negative comments and may lead the home audience to internalize gender and weight stereotypes. Television programs may also encourage anti-fat bias through the content viewers don't see. For example, studies have demonstrated that overweight people are underrepresented in television sitcoms, which may skew viewer perceptions of the prevalence of overweight people in the "real world" (Fouts & Vaughan, 2002).

In a study designed to measure anti-fat bias in young children, Bissell and Hays (2011) predicted that participants with greater exposure to the media would be more likely to exhibit greater anti-fat bias than those viewing less television; however, several other variables of interest were considered such as cognitive processing styles, demographic variables, and self-perceptions of body shape. Using two measures of explicit anti-fat bias and one measure of implicit fat bias, Bissell and Hays (2011) found in their study of 601 third to sixth grade children that fear of negative appearance evaluations and demographic variables were the strongest predictors of greater bias against overweight individuals. Television viewing was found to be a predictor of more positive assessments of overweight individuals, a finding contrary to what

was predicted. However, when other variables were considered in a hierarchical regression model, these variables – fear of negative appearance evaluations, an assessment of an individual's own fear of being overweight, and demographic variables – were stronger predictors of negative assessments and prevailed statistically. The Implicit Association Test was also used in this study to measure participants' automatic associations of specific adjectives (good, bad, pretty, smart, funny, useless) to one of two words – thin or overweight. Quite consistently, a majority of the sample assigned the positive adjectives to the word “thin” whereas a majority of the sample assigned the negative adjectives to the word “overweight”. This simply suggests that on some level, unconscious or subconscious, many of the children in the sample held attitudes or beliefs about overweight individuals that were negative.

In a similar study, Parrott and Bissell (2010) conducted a pre- and posttest between- and within-subjects experiment with 200 children in grades 1–8. Their findings identified several important variables in terms of predicted correlates of anti-fat bias, and these variables included individual factors (demographics, cognitive processing styles), social factors (dieting behavior at home, exposure to overweight peers and family), and mediated factors (exposure to thin-ideal programming). Findings suggest that of all demographic variables examined, age was the strongest predictor of anti-fat bias. Experimental condition was also an important variable in the level of anti-fat bias a child exhibited. In this study, participants were randomly assigned to one of five groups, four experimental groups (each viewed an image of an overweight boy or girl or an image of a thin boy or girl) and one control group (no image exposure). Children randomly assigned to the experimental group who viewed either an image of an overweight boy or girl were significantly more likely to have higher scores on both measures of AFB, meaning they were more likely to assign negative attributes to overweight individuals, and this was compared to responses of individuals exposed to the thin boy or girl and participants in the control group.

Of the two cognitive variables used in the Bissell and Parrott study (2010) – the experiential and rational processing scales – both were found to be significant predictors of anti-fat bias. Furthermore, implicit attitudes representative of fat bias were also evident across the sample, and these implicit attitudes were related to explicit attitudes of fat bias. Of importance here is participant age. Older children were higher on the rational processing scale whereas younger children were higher on the experiential processing scale. This suggests that the more a child thought about the overweight subject in the photograph, the less likely the child was to admit a bias against being overweight or obese. This conclusion seems to be supported by the fact that higher levels of rational processing were related to decreased levels of fat bias, and older children exhibited lower AFB.

If age and rational processing style predict decreased levels of anti-fat bias, an important question seems to be at what age does the bias develop? The negative attitudes toward overweight individuals were the highest in the younger children, and this could be a product of them answering truthfully rather than being fearful of admitting how they felt about the overweight subjects in the photographs. The

development of weight bias could also be a product of younger children being less familiar with what is considered to be socially acceptable.

Summary Discussion of Media Exposure and Anti-Fat Bias

Limited evidence exists examining the relationship between media exposure and an individual's likelihood to exhibit anti-fat bias or weight stigmatization. Content analysis of prime-time programming and children's programming suggests body shape norms are fairly narrow and could contribute to an individual's likelihood to uphold thinness as an ideal. The Bissell and Hays (2011) and Bissell and Parrott (2010) studies indicate that AFB and weight stigma are not just problems exacerbated by the media but that the individual and social factors (self-perception, demographics, household dieting behavior) can all contribute to an individual's development of negative attitudes toward overweight people. Media exposure remains an important variable though, as it is one of the several socializing agents and certainly a factor that helps shape an individual's view of social reality. This topic remains important to the scholarly community as a social issue because more children are becoming overweight or obese, and this trend appears to be increasing at an alarming rate.

Media and Obesity

Limited empirical evidence exists examining the relationship between media exposure and an individual's likelihood to be overweight or obese, simply because so many other factors – genetics, lack of physical activity, and increased consumption of high-calorie, low-nutrition foods and beverages – are equally (and sometimes simultaneously) relevant. A few general conclusions about the relationship between media and obesity can be made, however, and findings from more recent studies indicate that time spent with media is a key factor in an individual's likelihood to become overweight or obese. Morgenstern, Sargent, and Hanewinkel (2009) report a strong association between television viewing and obesity, and report in their study of just under 10,000 children from Germany and the United States that media use was directly related to participant BMI. For example, Morgenstern and colleagues found that when study participants had a television in their bedroom, their risk for overweight and obesity, essentially measured via BMI, was greater.

What isn't known from the studies reported above is which factor – BMI or media use – is a predictor or causal factor in the other. It could be argued that overweight or obese individuals, who are more likely to be sedentary, will spend more time with

media because they spend less time on other activities. The notion of television being used as a displacement for other activities was confirmed by a Cecil-Karb and Grogan-Kaylor (2009) study in that when parents perceived their child's outdoor environment or neighborhood to be unsafe, they were more likely to restrict outdoor activities in lieu of indoor activities, such as spending time with the media. Parental perceptions of neighborhood safety were significantly associated with their child's BMI, which was significantly associated with time spent with the media.

While time spent with media is one important variable in understanding predictors of overweight or obesity, the content viewed may also be a relevant factor. For example, the media may be responsible for the development of attitudes and beliefs about food, nutrition, and health (Powell, Szczypka, & Chaloupka, 2010; Taras & Gage, 1995), and if a child's belief system is shaped by negative health messages in the media, that child may be at increased risk for being overweight or obese. A recent study published by the Institute of Medicine of the National Academies (IOM report) indicated that the current practices for food marketing put children at a health risk because dietary patterns begin early in childhood and are shaped by social, cultural, and mediated factors, including television advertising. As studies over the last decade have shown, food ads targeted toward children have often emphasized unhealthy options versus healthy options. They further report that in the ads targeted toward children, few health-related messages were found but of the ones with some mention of health, the message was related to the food containing natural ingredients or that the food was low in calories. For children who spend a great deal of time watching television each day, exposure to unhealthy food messages may prevail.

The Kaiser Family Foundation reported in its 2010 study (Roberts, Rideout, & Foehr, 2010), *Generation M²: Media Use in the Lives of 8- to 18-Year-Olds*, that total media use by children between the ages of 8–18 was just under 11 hours a day, which represents a significant increase from time spent with the media based on data collected in 2004 (approximately eight and a half hours per day) and data collected in 1999 (approximately seven and a half hours per day). As reported in a more recent study, elementary aged children spent several hours a day watching television programs on the Disney Channel, Nickelodeon, and the Cartoon Network and spent additional time on the websites associated with those channels as well as websites targeted toward children (webkins.com, neopets.com, and playhousedisney.com) (Bissell & Hays, 2011). Additionally, food products that are associated with a media tie-in and that have a corresponding "toy" make resisting the food even more difficult.

In measuring a child's knowledge of nutrition and food preferences, it is important to examine media as one driving component in the development of knowledge, beliefs, and attitudes about the foods they consume. Media are often blamed for the increases in childhood obesity, but beyond articulating that children spend too much time with media, little is known about how the specific content children are exposed to may influence their thoughts and decisions about the foods they consume. Lowry, Wechsler, Galuska, Fulton, and Kann (2002) report in their study of high school students' media use and their rates of sedentary lifestyles and obesity that one in three White students, one in two Hispanic students, and three in four Black students

watched more television per day than what is recommended by the American Academy of Pediatrics (two hours per day). Most importantly, the authors report that in their sample, television viewing was found to be positively related to the consumption of high-fat foods and those participants who were overweight were also more likely to spend more time with television.

The general conclusion from these studies is that television viewing may be negatively related to children's food preferences, food intake, and nutritional knowledge because it may not only shape what they view to be healthy and good for them, but it may also shape their preferences for specific foods and affect how much food they eat while watching television.

The results of these studies shed light on the myriad factors that need to be considered in relevant theory development. From a theoretical perspective, cultivation theory is appropriate in better understanding how the media, especially television, may shape a child's sense of nutritional knowledge and food preferences. Given the conflicting messages found in some advertisements related to food – "it's fat free" or "low in fat" – children who are heavier viewers of television may find themselves more confused about healthy food choices than those who are exposed to less television. Even if advertisers are slowly addressing growing concerns related to obesity in children, the underlying premise of cultivation theory is that over time, viewers will adopt a view of the real world that more closely resembles that of the mediated world. Thus, it is especially important to have a clearer picture of the specific content children pay attention to and if newer technologies such as TiVo decrease the amount of time children spend watching advertisements.

With overall obesity rates on the rise and childhood obesity increasing in every state in the United States, understanding the social effect this has on children is an area in need of more scholarly attention. While the health consequences of obesity are irrefutable, the psychological damage associated with weight stigma or bias can also be quite detrimental. If children are engaging in unhealthy eating habits or if their preferences for food only include foods low in nutritional value, they may be setting themselves up for a lifetime of weight stigmatization on a societal level and health problems on an individual level. Knowledge of nutrition and food preferences may very well be directly related to an individual's weight and body shape, and in light of the research documenting that overweight characters in mediated contexts are perceived as deviants and that samples ranging from preschoolers to adults adhere to negative attitudes about overweight people, it seems evident that people who are overweight can face bias, prejudice, and discrimination in several contexts.

Directions for Future Research

Given the complexity of the body image distortion and weight stigmatization phenomenon, researchers must continue to study these issues from an interdisciplinary approach. Cognitive processing styles, an individual's home and social

environment, and media exposure are just some of the important factors that may help us better understand the way individuals process messages about the body. Through media literacy intervention programs, some individuals, especially children, may be better equipped to challenge messages that uphold thinness as a norm or ideal. Furthermore, through health literacy programs, individuals may be taught about the long-term consequences of extreme thinness or obesity and thus might take steps to prevent that from happening. More simply, we must educate children that social comparison with any target other will often lead to a negative outcome. More importantly, body image should be viewed in the context of health and not shape, size, or weight.

It is difficult to change the way people think, but it is important to take these steps through media and health literacy programs. Perceptions and beliefs about body image have developed and become entrenched, in part, because of the social, cultural and mediated emphasis on appearance and the thin ideal. A very important consideration in future studies is the perceived “realness” of mediated messages. With increased attention focused on the digital enhancement in still and moving images, it is possible women may be less inclined to feel the images influence them about their own body shape and size. The goal for future research should be to continue to find ways to combat the negative and/or harmful messages often found in entertainment media and to find ways to keep women and girls from destroying their physical and mental health at such early ages. Body image distortion is a mental health issue that could easily escalate to a public health crisis if preventative measures – on both ends of the body image spectrum – are not addressed. Some women and girls may be injuring themselves with too little food whereas others may be injuring themselves with too much. Regardless of where on the body image spectrum an individual is, the psychological and health consequences of extreme thinness or obesity are quite clear. The body of work in this area has proven useful in gaining better understanding of the way body image perceptions are formed and shaped. The key now is to continue this research with attention to an interdisciplinary approach so a more comprehensive picture of body image perceptions can be gained and women and men can start focusing on the things their body can do rather than how their body looks.

Tracing the Course of Reality TV Effects Research

Robin L. Nabi, Jiyeon So, and Theresa de los Santos

ABSTRACT

This chapter overviews the history of reality-based TV research, starting with efforts to define the genre and understand why people watch such programming, with particular attention to issues of voyeurism and desire for fame. The discussion then turns to research on the effect of reality TV consumption, which has progressed primarily through the lenses of cultivation theory, social cognitive theory, and perceived realism. Given the general focus on the negative effects of reality TV consumption, the chapter goes on to examine the possible benefits of watching reality TV, such as enhancing learning, coping potential, and cooperative behavior. The chapter concludes with some consideration of the health implications of watching reality TV programming, including desire for cosmetic surgery enhancements and motivation for healthy living.

Development of the Genre

Although its history reaches back to the early days of television, reality-based programming, or “reality TV”, did not gain substantial popularity until the dawn of the twenty-first century. Over 100 new reality programs have aired since the summer of 2000, and the genre continues to dominate as the newest staple of the TV diet in the United States and beyond (Reality TV World, 2010). Its increasing popularity among

viewers is matched by the increasing attention researchers have paid to understanding not only what constitutes reality TV but why it is so popular and what effects its viewing has on its audiences. In this chapter, we explore each of these issues, focusing on the documented as well as potential effects of reality TV viewing, with particular attention to the valuable outcomes that might emerge from consuming this form of programming.

Defining Reality TV

There is no clear industry standard or definition of reality TV. As a result, conceptualizations often err on the side of inclusiveness, capturing all programming claiming to present reality, including news programming, talk shows, and sporting events (e.g., Cavender & Fishman, 1998; Potter et al., 1997). Focusing solely on the programs that have emerged as part of the burgeoning reality TV phenomenon, like *Survivor*, *The Bachelor*, *American Idol*, and the like, Nabi, Biely, Morgan, and Stitt (2003, p. 304) defined reality TV programming as “programs that film real people as they live out events in their lives, contrived or otherwise, as they occur.” They further specify that reality programs are characterized by: “(a) people portraying themselves . . . (b) filmed at least in part in their living or working environment rather than on a set, (c) without a script, (d) with events placed in a narrative context, (e) for the primary purpose of viewer entertainment” (Nabi et al., 2003, p. 304). As their research indicated that most people find reality programming to be only somewhat real, the element of “unscripted”, rather than “reality”, is likely the more defining feature of the genre.

Despite the unifying elements that bridge the range of reality programs, there are substantial differences among such programs, suggesting several reality TV subgenres are likely to exist. Nabi, Stitt, Halford, and Finnerty (2006) identified five subtypes: romance (e.g., *The Bachelor*), drama (e.g., *Real World*), game show/competition (e.g., *Survivor*), talent (e.g., *American Idol*), crime (e.g., *COPS*), and informational (e.g., *Trading Spaces*), and this list is likely to expand and shift as new programs and formats emerge. For example, with the advent of personal makeover programs, like *What Not to Wear* and *Dr. 90210*, we imagine there may be a “personal transformation” subgenre. Similarly, programs such as *Extreme Makeover-Home Edition*, in which families facing extreme challenges are rewarded with a new home, *The Biggest Loser*, in which morbidly obese contestants compete to lose the most weight, or *Who do You Think You Are?* in which celebrities explore their ancestry, might be termed “inspirational” reality programming. Regardless of the number of subgenres of reality TV that may exist, we must point out that because any one program may contain qualities reflective of multiple subgenres, the boundaries among these categories are likely somewhat fluid. Thus, it is the qualities of the programs, not the categories *per se*, that are more interesting as the focus of research.

However, as we examine the course of reality TV research, it is evident that research has focused more on the genre in its entirety or, alternatively, on particular programs, rather than on the message characteristics that may cut across programming types. In the discussion below, we trace the evolution of reality TV research, beginning first with the fundamental issue of what attracts viewers to this type of programming before considering the possible effects such consumption may have on these audiences.

Why People Watch Reality TV

In light of the seemingly sudden onslaught of reality TV programming at the turn of this century, the questions at the forefront of researchers' minds were what sorts of people were attracted to reality TV and why did they watch. In the first investigation of these issues, Nabi et al. (2003) found that, demographically, viewers tended to be younger and have less formal education than non-viewers. Regarding traits of reality TV viewers, Reiss and Wiltz (2004a), in their examination of 16 basic human motives, concluded that the motivation for social status, or to feel self-important, most strongly related to reality TV consumption (perhaps as viewers can fantasize about achieving celebrity status), followed by the desire for vengeance (perhaps due to its association with enjoying competition). Further, Nabi et al. (2003) found that viewers high on impulsivity were more likely to view certain reality programs, like *COPS* and *Survivor* (probably due to their affinity for unscripted and thus less predictable action and outcomes) whereas viewers high on need for cognition were more attracted to other forms of reality programming, like *A Wedding Story*.

As to why viewers in general are drawn to reality TV, Nabi et al. (2003) found viewers were particularly drawn in by the suspenseful/unscripted nature of reality programs as well as the fascination of viewing others' interpersonal dynamics. However, the contrived elements and potentially manipulative editing were found to detract from its appeal. Of note, Nabi, Stitt, et al. (2006) found that people may enjoy reality programming for some of the same reasons they enjoy dramatic fictional programming. For example, they may experience positive emotions or be transported into the narrative (see also Hall, 2006). However, viewers seem to enjoy different subtypes of reality TV for different reasons. For instance, Nabi, Stitt, et al. found people enjoyed reality crime programs for what they learned, but reality-romance programs for the interpersonal insights gained. Given different underlying reasons for enjoyment, it is reasonable to imagine different program types might engender different types of effects, though there is, in fact, very little research on the actual influence of reality TV as discussed below.

Perhaps one of the most intriguing questions surrounding motivations for viewing reality TV involves the notion of voyeurism. That is, initial assumptions about reality TV included the idea that viewers received voyeuristic (i.e., illicit) gratification from

its consumption. Nabi et al. (2003), however, found little evidence that viewers received salacious pleasure in viewing or that they enjoyed watching others' pain, but rather were more curious about others' lives. Subsequently, Nabi, Stitt et al. (2006) found that curiosity about others as a gratification did differentiate reality-based versus fictional television enjoyment, though it did not predict enjoyment of all subgenres of reality TV.

Most recently, Baruh (2010) explored the notion of voyeuristic appeal in greater depth, arguing that audience members are drawn to reality TV as they are waiting for moments when the program participants drop their guard and reveal their true selves. In a direct comparison of curiosity about others (i.e., social comparison and sensitivity to the expression of others) versus the psychological orientation of voyeurism (i.e., pleasure from accessing what is usually not accessible), Baruh found that both curiosity and voyeurism associated with reality TV consumption, and when both were considered in tandem, voyeurism had marginally stronger predictive value. However, recent evidence suggests that reality TV does not have significantly more voyeuristic content than other types of programming, like crime dramas and situation comedies (Bagdasarov, Greene, Banerjee, Krcmar, Yanovitsky, & Ruginyte, 2010). Further, Papacharissi and Mendelson (2007) found that reality TV viewers valued entertainment and habitual, "pass the time" motives over that of voyeurism. Further, only people with low levels of physical mobility and interpersonal interaction were more likely to watch reality TV to fulfill voyeuristic (as well as companionship) needs, presumably due to the limits of their own social opportunities. Thus, although voyeurism is present as a possible gratification obtained from watching reality TV, it does not appear to be the most important viewing motive nor is it unique to that genre.

Another viewing motivation arguably unique to reality TV involves the notion of fascination with fame. As Reiss and Wiltz (2004b) argue, reality TV shows may be so popular with such a wide range of viewers because US television audiences strongly identify with the desire to be famous. Indeed, their data suggested that of the 16 values assessed with the Reiss Profile, the desire for status and fame was the personal value that best distinguished devoted, regular viewers of competition-based reality programs from other viewers. The authors argue that the attention bestowed upon winners of competition-based programs taps into the need of devoted viewers to enhance their sense of self-importance. In other words, they explain that reality TV shows allow viewers to fantasize about gaining status and fame: watching people like themselves becoming a "celebrity" gives them a sense of satisfaction that they too could become celebrities some day.

In sum, viewers of reality TV watch for many of the same reasons people watch other forms of television programming. However, the unique elements of reality TV – real people engaged in largely unscripted activities – give rise to at least two motivations for viewing – voyeurism/curiosity about others and desire for fame – that may explain viewership beyond what more traditional typologies of viewing motivations may achieve. Further, though reality TV does evidence wide appeal, those with

certain personality traits (desire for social status, interest in vengeance, impulsivity) may be especially drawn to the genre and/or receive more gratifications from their viewing.

Although viewing motivation is a key question addressed by scholars of reality TV (as is the case for other media forms, Chapter 6), a second critical area of research addresses the impact that viewing such programming has on audiences' thoughts and behaviors. It is to this set of research that we now turn.

The Effects of Reality TV Consumption

As we reflect on the relatively brief history of reality TV research, it is evident that despite some interesting forays into industry-based effects, like how the reality TV format has contributed to the organizational restructuring of the television industry (e.g., Collins, 2008; Yngvar, 2009), the vast majority of effects-based research focuses on the impact that viewing such programming might have on audiences' cognitive, emotional, and behavioral outcomes. In this vein, there are essentially two broad approaches to its study that mirror other orientations to the study of media influence: cultural studies and more empirical initiatives.

Cultural Perspectives on Reality TV

One major line of reality TV inquiry considers the construction of these programs from a cultural perspective, focusing on the ideological viewpoints conveyed about, for example, law and order, societal threats, and audience empowerment (Cavender, 1998; Fishman, 1999). For instance, Cavender and Bond-Maupin (1993) argued that law enforcement programs make use of storytelling conventions to encourage empathy with an unsuspecting victim who falls prey to evil, which, in turn, primes the notion that no place is safe. Cavender and Bond-Maupin further suggested that reality-based crime shows, like *America's Most Wanted* and *Unsolved Mysteries*, depict crime in ways similar to fictionalized crime shows, reinforcing existing cultural stereotypes about criminals and victims.

As the menu of reality TV offerings has expanded, so too has the research from this qualitative perspective, broadening to consider how such programs might impact audience views on class formation and management (McMurria, 2008; Shugart, 2006; Skeggs, 2009), consumerism (Dixon, 2008), confessional culture (Aslama & Pantti, 2006) and gender roles (Banet-Weiser & Portwood-Stacer, 2006). For example, Dixon (2008) argues that "extreme makeover" shows help to create and, in turn, are sustained by the impression that one can easily transform critical components of one's life – one's body, one's home, one's identity – if only one has enough resources.

Although these studies do a nice job of bringing to light the more subtle messages that may be conveyed by reality programming, their goals are not to illuminate the effects such programs have on audience cognitions and behaviors. Although they note the messages the content may convey, it is the empirical work that documents the actual influence reality TV has on the viewing audience.

Empirical Approaches to Reality TV Effects

The bulk of the empirical work assessing the relationship between program consumption and beliefs about the social world and the self draws largely from cultivation theory (e.g., Gerbner, 1969; Chapter 2, this volume). As such, this research examines how what is portrayed as reality in reality TV programs might differ from the real environment, and how such misrepresentations might, in turn, lead to audiences' misperceptions about the world at large. Crime-related programs, like *COPS*, served as the initial focus for this line of inquiry (see Fishman & Cavender, 1998), and in essence, extant research suggests that such programs overrepresented violent crime, crimes solved, non-Whites as offenders, and Whites as law enforcement officers. Research has also found that such misrepresentations can influence the way audiences think about crime in society. For example, Oliver and Armstrong (1998) found that Caucasians who were frequent viewers of reality crime programs were more likely to exaggerate crime prevalence estimates than those who watched less of this type of programming, suggesting they might be more likely to see the world as a dangerous and scary place. Relatedly, Eschholz, Blackwell, Gertz, and Chiricos (2002) found that viewing programs, like *COPS*, strengthened confidence in law enforcement agencies, especially for White viewers.

As the scope of reality TV programming expanded, so too did the queries regarding how such programs influenced personal and societal expectations. For example, as "dating" programs, such as *The Bachelor*, *Temptation Island*, and *Joe Millionaire* emerged, questions about their influence on viewers' perceptions of dating partners and appropriate behavior in the context of dating relationships also emerged. For instance, Ferris, Smith, Greenberg, and Smith (2007) found that exposure to reality dating programs and perceived realism of such programs was associated with viewers' adoption of the dominant themes portrayed in them, including "dating is a game" and "women are sex-objects." Further, more frequent viewing of reality dating programs was associated with self-reports of behaviors typically found in such programming, including drinking alcohol and using hot tubs early in a dating relationship. Relatedly, Clark, Nabi, and Moyer-Gusé (2007) found that viewing "reality" dating programs, like their fictional counterparts, significantly associated with earlier expectations of sexual behavior – for oneself and one's peers – as well as earlier self-reported sexual behavior.

Most recently, the onslaught of personal makeover programs, especially those that involve cosmetic surgery, like *I Want a Famous Face* and *Extreme Makeover*, have raised

the question of whether viewers are more likely to perceive plastic surgery as more common as well as a more desirable option for the self. Indeed, evidence suggests that more frequent exposure to such programming is associated with stronger desire to undergo cosmetic enhancement (Nabi, 2009).

In essence, despite their vast differences in the content of interest, the lines of research traced in this chapter share a common theme. That is, they all examine how consumption of subgenres, or even particular programs, under the label “reality TV” associates with societal perceptions and expectations. This is wholly consistent with the vast quantity of research from the cultivation perspective that exists in the extant media effects literature (see Morgan, 2009). However, the cultivation-based research within the domain of reality TV arguably distinguishes itself in that the content under study has at least some *prima facie* claim to representing reality. That is, it is tacitly assumed that such programs may have greater influence given their inclusion of real people experiencing real outcomes, even if circumstances are contrived to some degree.

To the extent that reality TV programs are both perceived as more realistic than other programming formats and also misrepresent reality, this is an important line of inquiry. Indeed, this was the case in Ferris et al.’s (2007) research in which those who perceived dating programs to be more realistic were also more influenced by their viewing. However, as Nabi et al. (2003) noted, reality programs, though perceived as more real than fiction, are not necessarily seen as particularly real. Specifically, in a multidimensional space configuration derived from a reality program-sorting task, one of the two key dimensions to emerge was “fiction-reality”. Reality shows fell closer to the “reality” end of the fiction-reality continuum than situation comedies, dramas, and soap operas, but still fell at only about the midpoint along that continuum. Further, given there are multiple ways to conceptualize realism (e.g., event similarity, factuality, probability, typicality; Shapiro & Chock, 2003), it is possible that fictional programming may, in some instances be seen as comparably real or even more real – not in terms of event factuality but in terms of event probability, or the likelihood of the depicted events occurring in real life. Indeed, Clark et al. (2007) found that “reality-based” depictions of dating relationships were not seen as any more or less real than the fictional depictions. Thus, although in some instances reality TV may be perceived as more real than fictional programming and thus may be more likely to cultivate perceptions about the world as a result, we must not assume that this is always, or even usually, the case (see Potter, 1986).

Although the contrived nature of reality TV program construction, coupled with the often realistic tone of fictional programming, renders the variable “perceived realism” less compelling in the context of reality TV than one might imagine at first, the construct of identification may be more promising given that no matter how contrived the programming, there is no escaping the fact that real people are experiencing the outcomes portrayed. As such, viewers’ identification with those program participants may be of particular interest, and it is to this key issue that we now turn.

Identification and Involvement with Reality TV Personalities

Generally speaking, identification with media characters has proven to be an important variable in the study of the effects of entertainment media on audience perceptions and behaviors (Chapters 11, 13, this volume). In essence, identification refers to an imaginative process through which an audience member adopts the identity and perspective of a media character (Cohen, 2001). Specifically, Cohen argues that identification is a multidimensional construct with four major components: empathic (sharing the feelings of the character), cognitive (sharing the perspective of the character), motivational (sharing goals of the character), and absorption (the loss of self-awareness). He further asserts that identification may be triggered by a range of antecedents, including narrative message structure; similarity of the audience member to the character based on demographics, attitudes, personality traits, or life circumstances; perceived realism of the character; familiarity with the character; and certain personality traits, like self-esteem.

Identification may be particularly relevant in the context of reality TV as these programs cast real people – often ordinary folks with challenges in their jobs, families, relationships, careers, and health perhaps similar to the viewing audience. Given these reality TV personalities are in fact real people experiencing real events, audiences may become more involved in the program and relate to those individuals more readily than to media characters portrayed by actors and actresses, who are not actually experiencing the events portrayed (Hall, 2009). Further, the content of reality TV programs may be especially relatable to viewing audiences. Indeed, Hiltbrand (2004) argues that teenagers, who occupy a large proportion of the reality TV viewership, are strongly attracted to reality TV shows as they frequently address issues with which they can readily identify – relationships and rejection.

Despite its obvious relevance, only a few studies to date have examined the concept of identification in the context of reality TV. For example, identification has been cited as one of the reasons why adults choose to watch reality programming (Nabi et al., 2003). Identification has also been examined as a moderator of the effects of viewing reality TV on audiences' perceptions and behaviors. From a social cognitive theory perspective (Bandura, 1986), those who identify more with reality TV cast members would be expected to adopt their behaviors if the positive outcomes experienced by the program participants outweigh the negative ones. Nabi (2009) tested this prediction in the context of cosmetic surgery makeover programs and found that greater identification with the program participants did indeed predict greater expressed likelihood of undergoing invasive cosmetic enhancements when the program participants were perceived as having experienced positive outcomes. Further, those with lower body satisfaction who also identified with program participants expressed greater desire for invasive cosmetic procedures.

Thus, there is emerging evidence that identification with reality TV program participants may influence effects ranging from simple exposure to the programming to the emotional, cognitive, and behavioral outcomes that result from viewing. As noted with perceived realism, we do not suggest that these outcomes follow a different process as identification with fictional characters, but rather that this process is more likely to be engaged as a result of the types of people cast in reality TV programs and the situations in which they are placed. However, this still remains an open question awaiting empirical support.

We would perhaps be remiss were we not to mention in this discussion an audience activity related to identification – that of parasocial relationships (PSR). Parasocial relationships refer to the seeming face-to-face relationships that develop between an audience and mediated personalities. Audience members in a parasocial relationship respond to the media character as if he/she were a friend or a personal acquaintance (Giles, 2002; Horton & Wohl, 1956). PSR differs from identification in that the latter lacks the interactional element. With PSR, a perceived relationship with the character develops in which the viewer maintains her or her own identity. With identification, the viewer sees him or herself as that character and sees the story events through that character's eyes (Cohen, 2001).

As with identification, research has revealed that reality TV viewers report parasocial relationships as a motivation for consuming the genre (Nabi et al., 2003). However, in their survey results, Nabi et al. found that viewers experienced greater parasocial gratification from watching fictional than reality-based programming (Nabi et al., 2006). Still evidence suggests that PSR may be a factor underlying the enjoyment of some forms of reality TV, like competitive game shows (e.g., *Survivor*; Nabi et al., 2006).

In terms of effects, there is actually minimal investigation of PSR in the context of reality TV. An exception is Schiappa, Gregg, and Hewes' (2005) study of the effects of parasocial interaction (PSI) with gay cast members in *Queer Eye for the Straight Guy*, a reality-based makeover show with five gay professionals assisting a heterosexual male, on prejudice against homosexuals. Consistent with their parasocial contact hypothesis, increased parasocial contact with gay cast members led to a decrease in prejudicial attitudes against homosexuality. Moreover, the level of prejudice was negatively related to the degree of parasocial interaction with these characters. Thus, it is evident that PSI may play a role in influencing the beliefs of reality TV audiences. As we have seen with television's ability to influence gender roles especially when identification processes are triggered (Chapter 11), the process of relating to characters is an important concept for reality TV viewers, as well.

In light of the dearth of evidence in this area, there are several ways in which research might progress to elaborate how reality programming might stimulate PSR and related cognitive, emotional, or behavioral effects. For example, consistent with meta-analysis results regarding PSR (Schiappa, Allen, & Gregg, 2007), it is likely that the more a reality program includes cast members who generally seem like somebody the viewers can be friends with (or similar to their actual friends; e.g., *Survivor*

vs. *16 and Pregnant*) the more likely PSRs are to develop. As well, certain presentational techniques of reality TV may encourage PSR. Specifically, a hallmark of the reality TV genre is the inclusion of cast members' video diaries in which they disclose their thoughts and feelings about the events portrayed, and as Auter (1992) demonstrated empirically, a character's disclosure via talking to the camera/audience increases PSR. Further, to the extent reality TV shows are perceived as real, PSR may also increase (Schiappa et al., 2007). Thus, under certain circumstances, parasocial relationships may be enhanced by the reality TV format and consequently may be of particular importance when studying its effects.

It is clear that there is much room for future research on both identification and parasocial relationships in the context of reality TV. Most notably, understanding how aspects of reality TV programs, like self-disclosure, influence each of these two psychological states and to what effect would not simply enrich our understanding of this newer genre but also of the often conflated relationship between these two variables.

In summary, whereas perceived realism does not appear to be directly linked to the reality TV format, both identification and parasocial relationships may be enhanced by the type of people cast as well as the construction of reality TV programs in which familiar personality types in relatable situations disclose their thoughts and feelings directly to viewers. Of course, the research in this area is only in its infancy and future investigations would benefit from exploring these constructs further in terms of how frequently they occur, under what circumstances, and what their role in facilitating impact on audience attitudes and behaviors may be.

Exploring the Benefits of Reality TV Viewing

From its inception, the prevailing assumption has been that reality TV is a blight on the TV programming schedule, appealing to viewers' most base, voyeuristic compulsions and giving them the opportunity to delight in others' misfortune (Poniewozik, 2000). Not only have the motivations for viewing been cast in a rather unflattering light (as discussed above), but the effects of viewing in terms of distorting perceptions of reality in areas such as law enforcement and relationships have also been framed as overwhelmingly negative.

However, there are several ways in which reality programs might benefit viewing audiences. First, reality programs may serve as a source of useful information. Indeed, Nabi et al. (2003) and Nabi, Stitt, et al. (2006) found viewers often felt like they learned something about themselves and relevant life situations by watching reality TV. More specifically, Palmer (2004) found young adults learned about dating; relating to their families; and dealing with sensitive health issues, such as HIV/AIDS, cancer, and mental illness, by watching the way reality TV show participants dealt with these issues.

Second, reality programs may serve as a useful resource for coping with life experiences. For example, Nabi, Finnerty, Domschke, and Hull (2006) found that watching a composite episode of the MTV reality program *The Real World*, which chronicles the lives of seven young adults chosen to live and work together for several months, helped young adults cope with their lingering regret over past infidelities. Although research may not yet exist on the matter, it is also likely that other programs serve a similar function. For example, TLC's *A Baby Story*, which follows women through the final weeks of their pregnancies and into the initial weeks post-birth, may help expecting mothers and fathers as they cope with the stresses of pregnancy and impending parenthood. Similarly, ABC's *Supernanny*, in which an experienced nanny counsels parents of habitually unruly children, cannot only help viewers learn valuable parenting skills but also serve as a valuable source of reassurance and stress-reduction. To the extent that viewers learn from these and other such programs and apply positive lessons to their own life circumstances, their overall stress and uncertainty may be reduced.

Further, reality programming may promote positive virtues in viewing audiences. For example, Kiesewetter (2004) argues *The Ship*, a reality program in which 40 volunteers retraced Captain James Cook's 1770 voyage from Australia to Indonesia, depicts, and thus may inspire, cooperation, helpfulness, and selflessness (as opposed to competition, like many reality TV shows). More recently, programs like *Extreme Makeover–Home Edition* and *Undercover Boss* embody the ideals that goodness will be rewarded and that cooperation and teamwork are critical to success.

Reality TV and Viewers' Health

In keeping with the growing trend of interest in the role of the media in the health of viewing audiences, we would be remiss were we to omit consideration of the effects of reality TV viewing on physical health and well-being. As with research on media effects more broadly, this literature generally associates reality TV consumption with potentially unhealthy behaviors. For example, Blair, Yue, Singh, and Burnhardt (2005) analyzed depictions of alcohol, tobacco, and drug use in episodes of MTV's *The Osbournes* and found that 75% of the alcohol and tobacco messages implied endorsements for using these substances. Zurbriggen and Morgan (2006) found that for both men and women, viewing reality dating programs, like *Eliminate*, *Blind Date*, *Dismissed*, and *Joe Millionaire*, associated with adversarial sexual beliefs (e.g., men are only out for one thing, a lot of women seem to get pleasure in putting men down). Further, Manganello and McKenzie (2009) examined the presence or absence of child safety products as well as discussion of injury topics in reality TV programs including *Extreme Makeover–Home Edition*, *Supernanny*, *Room by Room*, *Trading Spaces*, and *Bringing Baby Home*, that focus on home renovation or family life and parenting. Although such programs may have the potential to help educate

adults regarding safe practices, like checking the water temperature when bathing a child or having smoke alarms in the home, such safety behaviors were rarely shown or discussed in these programs.

More recently, several studies have considered how the spate of reality programs featuring cosmetic surgery, such as *Extreme Makeover—I Want a Famous Face*, and *The Swan*, influence viewer attitudes toward cosmetic surgery and decisions to undergo potentially risky surgery (Crockett, Pruzinsky, & Persing, 2007; Markey & Markey, 2010; Nabi, 2009) as well as their possible effect on disordered eating among women (Mazzeo, Trace, Mitchell, & Gow, 2007; Sperry, Thompson, Sarwer, & Cash, 2009, for a more general discussion of body image and media, see Chapter 15). In this vein, Nabi (2009) found that though there was little relationship between cosmetic surgery makeover program viewing and body satisfaction or perception of risk of undergoing cosmetic surgery, a small positive association with desire to undergo cosmetic surgical procedures emerged. This relationship persisted even after taking into account general TV consumption as well as other factors, like identification with the program participants or the nature of the outcomes depicted. Further, as noted earlier, the evidence supported the role of behavioral modeling in this relationship. That is, the more young people identified with program participants and the more positively they viewed the outcomes of the participant's cosmetic enhancements, the more likely the viewers were expecting to engage in similar (perhaps risky) behaviors.

Similarly, Markey and Markey (2010) found that individuals who had a positive impression of reality TV programs featuring plastic surgery transformations were more likely to want to alter their bodies and faces via cosmetic surgery. They further found in their experimental research that participants who watched *Extreme Makeover* were more likely to indicate a desire to obtain cosmetic surgery than participants who watched a home improvement program. Taken together, these results suggest that reality TV may promote unhealthy or potentially risky behaviors, in part due to the behavioral modeling that may occur when viewers identify with program participants.

The evidence to this point overwhelmingly focuses on the negative health implications of consuming reality TV. However, it is essential to emphasize that it is the content of the programs, and more specifically the content that has been the focus of researchers to this point, rather than anything inherent in the genre form itself, that has resulted in this perception that reality TV consumption is unhealthy. Yet a new wave of health-oriented reality programs suggests that positive effects are not only possible but likely.

In response to the obesity health crisis in the United States in which nearly 34% of adults in 2007–2008 could be classified as obese and the proportion of obese children reached 17% (Flegal, Carroll, Ogden, & Curtin, 2010; Chapter 15, this volume), a newer generation of reality programs has been designed not only to encourage contestants to lose weight, but to inspire healthier behaviors in home viewers as well. Premier among these is *The Biggest Loser*, in which morbidly obese contestants compete to see who can lose the most weight through a combination of supervised

exercise and diet regimens. Each episode is also interspersed with trainer's tips on how home viewers can make simple changes to encourage a healthier lifestyle. Based on the argument above regarding identification with contestants as well as the educational information conveyed through the trainers' tips, one can imagine that viewing *The Biggest Loser* might encourage home viewers to make healthier choices with their own exercise and diet behaviors.

Although no published research speaks directly to this point, one unpublished study hints at the potential of reality TV to influence positive health behaviors. In their research, Thomas and Nabi (2009) randomly assigned participants to watch an episode of *The Biggest Loser*; an episode of another competition, but non-health related reality program (*America's Toughest Jobs*); or a health-oriented episode of a situation comedy (*The Office*) and explored the effects on self-efficacy regarding healthy eating and exercise. Although character identification effects were not detected in this study (which is unsurprising given the sample was comprised of generally healthy undergraduates of normal weight), results indicated that viewers of *The Biggest Loser* who perceived the program's events as more real also reported greater confidence in their ability to eat healthy and to exercise, and those who perceived both the events and people as real reported a greater motivation to exercise. Thus, there is evidence, albeit limited, that reality programming can be used to influence underlying motivations and efficacy, which may ultimately positively impact health-related behaviors.

Other television programs have also emerged to target the obesity crisis. For example, *Jamie Oliver's Food Revolution* revolves around the chef's mission to change the eating habits of the "unhealthiest city in America" – Huntington, West Virginia. As a result, viewers, along with citizens of Huntington, can learn about proper nutrition and how to make simple, healthy meals at home. Further, reality programs are beginning to address other health issues beyond obesity. For example, the A&E program *Intervention* profiles individuals whose dependencies on drugs and alcohol or other compulsive behaviors have reached a crisis point such that friends and family, with the help of trained professionals, stage an intervention to motivate the afflicted person to enact real behavioral change. VH1's *Sex Rehab with Dr. Drew* targets compulsive sexual behavior. A&E's recent offerings, like *Hoarders* and *Obsessed*, focus more on mental health, depicting the real-life struggles and treatment of people suffering from anxiety disorders and related compulsive behaviors. One might even argue that NBC's *The Baby Borrowers*, billed as a social experiment in which teenagers who think they are ready for parenthood "borrow" infants, toddlers, young children, and preteens for a few days each to see what the demands of parenthood entail, might impact family planning decisions. Indeed, the tag line to the program was "It's not TV, it's birth control."

Despite the enthusiasm with which such programs may be greeted by those eager to see the power of the media harnessed for positive effect, we must note that there is always a risk that these health condition depictions may veer towards sensationalism, thus reinforcing and perpetuating stereotypes and paving the way towards

further marginalization of afflicted populations. For example, Sender and Sullivan (2008) argue that *The Biggest Loser*, despite the beneficial tips audiences may glean for healthy living, continually associates the concepts of “fat” and “lazy”, thus reinforcing the view that those who are obese are so because of their own lack of will. Similarly, though *Hoarders* may be seen as a show that not only offers insight into a unique form of obsessive compulsive disorder, it may also sensationalize the illness thus further marginalizing victims of mental illness.

In summary, although most research on the effects of reality TV on viewer health tends to focus on negative effects, and indeed negative effects on viewers’ health and well-being have been identified, emerging programs take advantage of this popular format to promote positive health outcomes for program participants. Consequently, through the processes of learning as well as behavioral modeling, it is reasonable to imagine that these programs have the potential to promote positive health outcomes in viewing audiences as well, though unintended negative consequences must not be overlooked.

Conclusion

Although reality TV has a history that arguably reaches back to the 1940s, it is only in the past 20 years – really the past 10 – that the genre has come into its own. As such, the research on its effects is still in its infancy. Issues regarding why people watch and the (generally negative) effects on viewers’ cognitions and behaviors have been the focus of research. But recently, as the scope of reality programming has expanded to encompass positive social and health-related messages, threads of research on the positive effects of these programs are emerging.

At this point, it is critical to note that though reality TV tends to be explored separately from other forms of programming, the processes through which fictional versus reality TV programming culminate in effects are unlikely to be different from one another. In this sense, reality TV is not unique. To the extent that reality TV is perceived as more real, this may contribute to the likelihood and intensity of effects. However, given reality TV is often not seen as being particularly real, these outcomes must not be assumed. To the extent audiences identify more with reality program participants, the possibility of behavioral modeling may increase. However, again, we must be cautious as there is not yet sufficient evidence to support the claim that viewers identify more with reality program participants compared to television characters. Further, given the overwhelming majority of research on the genre’s effects is based on correlational data, the claim of effects on attitudes and behaviors still awaits stronger empirical support.

Still, there are relatively unique elements of reality programming, including the inclusion of real people, the unscripted events, and its interactive nature, that make it worthy of closer scrutiny as we consider the influence its viewing may have on

audiences. For example, scholars might consider exploring issues related to the suspense associated with the unscripted endings and the unsatisfying endings that sometimes occur as a result, which may lead to different emotional effects compared to fictional programming. In addition, greater exploration into the role of self-disclosure in promoting or impeding voyeurism as well as identification may be of value, especially given that these psychological states may predispose or limit effects on attitudes and behaviors.

A particularly unique element of reality TV involves its often interactive nature, in which audience members may affect program outcomes through voting. Interactivity is one of the reasons young people are attracted to reality TV (Hiltbrand, 2004), and the agency attached to the influence interactivity offers may have implications for viewing frequency, identification, involvement, and, in turn, the emotional, cognitive, and behavioral outcomes that may ensue (e.g., see Godlewski & Perse, 2010). Indeed, understanding the dynamic and likely reciprocal nature of the relationships among interactivity and these variables would be a very interesting direction for future research. Thus, though the process of effects may not be different for reality TV compared to other forms of programming, its unique features may influence the intensity and likelihood of effects, which would indeed be a valuable route for future exploration.

Future research should also continue to expand upon the nascent literature on the positive and health-related effects of reality TV – both physical and psychological, especially as compared to other television genres. To pursue this sort of research agenda would surely add a more interesting and nuanced understanding of this fascinating, though often maligned, genre of television programming.

Media-Related Fear

Short-Term and Enduring Consequences

Cynthia A. Hoffner and Elizabeth L. Cohen

ABSTRACT

Fear responses to media exert a powerful influence over people's perceptions, expectations, and behavior. Grounded in emotion theory, this chapter provides a framework for understanding fear responses to mediated threats in three areas of media scholarship: immediate responses to media, risk perceptions, and intergroup relations. First, the chapter examines why and how mediated messages evoke fear, and the consequences of fear during and after media use. Second, theory and research on the relationship between media-induced fear and risk perceptions are reviewed. Third, media-related fear is examined in the context of social relations, focusing on (1) how framing various groups as threats can lead to fear, stereotyping, and behavioral responses, and (2) how groups portrayed as threats respond when anticipating media influence on others. Finally, limitations of the literature and suggestions for future research (including the role of new technologies) are discussed.

Fear and Anxiety in the Context of Emotion Theory

Threats and danger are familiar features in the media landscape, and fear and anxiety are common emotional responses to these depictions. Several recent reviews have addressed responses to frightening media, most with a focus on children (e.g., Cantor,

2009). This chapter addresses fear in relation to media from a broader perspective by examining not only immediate and lingering fear responses to media, but also fear-related media influences on risk perceptions, and the role of media-related fear in intergroup relations. A framework grounded in emotion theory is presented first, as a way to integrate media research in these three related areas of scholarship.

Broadly defined, fear is an aversive emotional response to threat or danger (Ohman, 2008; Rosen & Schulkin, 1998). Many words in the English lexicon describe fear-related responses, reflecting subtle differences in emotional experience. Yet their usage also reveals a distinction between the core emotion of fear (e.g., fear, terror) and anxiety (e.g., anxiety, worry, dread). Ohman (2008, p. 710) contends that fear and anxiety differ somewhat as subjective experiences, but argues that they are “overlapping, aversive, activated states centered on threat.” Given the complexities of media offerings and the diverse issues explored in research, a variety of terms are used in the literature to describe fear-related responses. Because this chapter draws connections among different bodies of literature that have studied related phenomena, we consider the concept of fear broadly in our discussion.

Elicitation of Fear

Appraisal theories of emotion provide one way of thinking about the elicitation of fear in the media context. According to Ellsworth and Scherer (2003, p. 573), “the basic premise of appraisal theories is that the organism’s evaluation of its circumstances (current or remembered or imagined) plays a crucial role in the elicitation and differentiation of its emotions.” Appraisals can range from rapid, automatic processing to more deliberate, effortful processing (Clore & Ortony, 2008; Lazarus, 1991). Most appraisal theories agree that a small set of appraisal dimensions combine to produce specific emotions such as fear, anger, or sadness. In appraisal terms, fear is defined as an anticipatory emotion that is evoked when an individual appraises a stimulus as a threat to personal well-being, including physical safety, goals, or plans. Fear is associated with appraisals of low power or minimal control over the situation. The appraised importance of what is threatened and the degree of disruption or harm posed by the threat influence the intensity of fear (Ellsworth & Scherer, 2003; Lazarus, 1991; Ohman, 2008). Appraisal theorists also acknowledge that memory can play a role in the elicitation of emotion (Clore & Ortony, 2008). For example, environmental stimuli can activate fear-related memories or trigger conditioned fear responses (LeDoux, 1996; Ohman, 2008).

Consequences of Fear

According to evolutionary approaches to emotion, fear evolved to maximize chances of survival by alerting organisms to danger and motivating self-protection (Tooby &

Cosmides, 2008). Thus, fear is associated with increased environmental vigilance and a tendency to perceive stimuli as threatening, which can intensify fear through reciprocal influence (Ohman, 2008). In terms of behavioral responses, escape or avoidance is likely when an individual has little perceived ability to cope with a threat (Lazarus, 1991). But if the threat seems imminent and inescapable, fear may lead to attack – that is, fight rather than flight (Rosen & Schulkin, 1998). Yet behavioral responses to fear are determined by multiple factors. Ohman (1986) argued that the urge to escape from an attacking animal is relatively unproblematic, but that threatening social contexts can complicate behavioral motivations by introducing competing concerns, such as the need to avoid harm but also look brave in front of others. Moreover, protection from a threat sometimes requires more than simple escape, and the perceived efficacy of a protective action will influence whether it is taken (Witte, 1992). In addition, fear and other emotions (especially anger) sometimes co-occur in response to threat, leading to conflicting behavioral motivations (Lazarus, 1991; Lerner & Keltner, 2001). Finally, some scholars argue that the influence of emotion on behavior is largely indirect. Baumeister, Vohs, DeWall, and Zhang (2007) contend that emotion shapes behavior primarily through feedback, appraisal, and learning. Thus, in addition to directly motivating self-protective actions, fear may lead people to anticipate particular outcomes and alter future behavior.

Emotion Regulation Processes

The experience of fear also often motivates efforts to regulate emotion (Gross & Thompson, 2007; Lazarus, 1991). During media exposure, people may use cognitive or behavioral strategies to manage or reduce fear (Cantor, 2009), or may appraise their fear in a way that facilitates enjoyment (Bartsch, Vorderer, Mangold, & Viehoff, 2008). Media-related fear and anxiety can play a longer-term role in risk perceptions and intergroup relations, and the ways that people cope in these contexts – by actively addressing perceived threats versus regulating emotional responses – can have important individual and social implications (Kemper, 2000; Loewenstein, Weber, Hsee, & Welch, 2001).

Immediate and Lingering Fear Responses to Media

Threats such as crime, interpersonal conflict, and terrorism depicted in entertainment and news media often lead to fear, despite the fact that these portrayals usually pose no imminent threat to the audience (Cantor, 2009). Why do such messages evoke fear, and what are the consequences of fear during and after media use? This section examines these questions.

Factors Influencing Fear Responses

Responses to Direct Fear-Evoking Depictions

People often have direct fear responses to stimuli and situations depicted in the media. Angry, threatening faces, animals such as snakes and spiders, depictions of blood or injuries, and dark, isolated locations are all common elements of fear-evoking media portrayals. Evidence suggests that environmental cues like these can evoke fear automatically (LeDoux, 1996; Ohman, 2008). Scholars contend that humans are biologically prepared to develop fears of certain stimuli that posed a threat to our ancestors' survival. Ohman (2008) asserted that the four main types of fears – social fears (e.g., aggression, rejection), animals fears, fears related to death, blood and injury, and fear of wide open and closed spaces – are associated with adaptive behavioral systems shaped through evolution, and correspond to the most common types of phobias. Cantor (2009) argued that direct fear responses to specific media stimuli might be the result of stimulus generalization (a term derived from classical conditioning), in which depictions that resemble fear-evoking stimuli evoke a similar, but reduced, fear response. Thus, a spider shown onscreen may arouse fear, in part, because its perceptual features are similar to a real spider one might actually encounter. Less realistic-looking portrayals, or even verbal references, may evoke fear among people who are able to construct vivid mental images of fear objects (Sparks, Sparks, & Gray, 1995).

Sound also plays a role in evoking fear responses to media. People respond emotionally to vocal expressions of emotion and to a wide variety of environmental sounds, although context and past experience can modify responses (Bachorowski & Owren, 2008; Bradley & Lang, 2000). Vocalizations such as screams, as well as other sounds, can signify threat and function as warnings. Even when no threat is present, as when viewing media, automatic responses to sound cues can elicit fear. Music also can evoke a range of emotions, including fear and anxiety (A. J. Cohen, 2001).

Individuals differ in what frightens them based on personal history and patterns of appraisal (Ellsworth & Scherer, 2003). Preexisting fears can be evoked by media stimuli that resemble fear-evoking objects or remind people of frightening past experiences (LeDoux, 1996; Ohman, 2008). Neuendorf and Sparks (1988) found that prior fear of particular objects (e.g., dead bodies and cemeteries) was associated with more fear while viewing films that involved those cues. Similarly, people who have experienced trauma feel greater fear or anxiety in response to related events in the media (e.g., Long, Chamberlain, & Vincent, 1994).

Responses to Stories About Other People

Another factor in media-induced fear is responsiveness to other people. According to appraisal theory (Lazarus, 1991), fear arises from a perceived threat to personal well-being, which can include a threat to someone or something an individual values. Most entertainment and news media feature stories about people, and often show them in dangerous circumstances.

People respond more emotionally to the circumstances or experiences of people whom they like or care about. According to disposition theory (Zillmann, 2006), affective dispositions toward characters are based on moral evaluations, with approval of actions leading to more liking and caring for the characters, and greater emotional involvement in depicted events. When danger threatens a character, emotional responses are a function of both affect toward the character and the nature of the feared outcome, with more fear associated with severe threats to liked characters. Beyond affective dispositions, there are at least two ways people can be involved with media figures. Parasocial interaction entails responding to a media persona as a friend or interaction partner, which may develop into a long-term parasocial bond (Giles, 2002). Identification occurs when media users imagine themselves as a character, effectively taking on the character's identity while viewing a film or playing a videogame (J. Cohen, 2001; Klimmt, Hefner, & Vorderer, 2009). In general, studies show that involvement with endangered media persona enhances fear and suspense (e.g., Hartmann, Stuke, & Daschmann, 2008; Hoffner & Cantor, 1991).

Empathy is a key individual difference that moderates emotional responses to other people. There are many definitions of empathy in the literature, but most include empathic concern, or feeling for another person, and emotion-sharing, or feeling as another person (Batson, 1991; Davis, 1994). Empathy is enhanced when there is a close attachment to the other person, and may occur based on anticipated responses of that individual. Thus, fear during suspenseful scenes may be partially a function of empathy with expected responses of unsuspecting characters, especially those with whom the viewer has a close affective bond (Zillmann, 2006). Tamborini (1996) proposed that empathy should lead to greater negative emotion in response to horror films, primarily due to distress at witnessing the pain and suffering of other people. Several studies of responses to both entertainment and news have yielded findings consistent with this proposal (e.g., Harris et al., 2000; Hoekstra, Harris, & Helmick, 1999; Hoffner, Fujioka, Ye, & Ibrahim, 2009) demonstrating that empathy plays an important role in responding emotionally to the threat of harm to others.

The structure and format of threat-related stories also can influence appraisals and emotions (Lazarus, 1991; Mikos, 1996). In a narrative, cues that signal an impending threat can affect how viewers appraise subsequent seemingly-innocuous events, and can increase suspense and worry about endangered characters. Research with both children and adults has shown that fear and worry are intensified by forewarning of a threat in a scary program, and reduced by prior knowledge that the characters will escape harm (de Wied, Hoffman, & Roskos-Ewoldsen, 1997; Hoffner, 1997; Hoffner & Cantor, 1990). Music enhances foreboding in film narratives, and heightens emotional responses to scary episodes, such as the shower scene in *Psycho* (A. J. Cohen, 2001). To some extent, fear responses depend on an understanding of genre conventions that allow media users to recognize signals of impending danger, or understand when threats are not credible or are likely to be addressed effectively by the characters (Mikos, 1996; Zillmann, 2006). Absorption or transportation into a narrative enhances emotional involvement and should increase the potential for fear to develop in

response to threat portrayals (Green & Brock, 2000). As such, the increasing use of mobile devices for content delivery may alter media users' emotional responses, due to differences in screen size, level of concentration, and other factors (cf. Spence, Lachlan, & Westerman, 2009).

"This Could Happen to Me"

Fear reactions to media are also related to the perception that portrayed events are a threat to personal well-being. Even if depicted events are fictional, people may believe or imagine that similar events could happen to them or people they care for. Media scholars (e.g., Sparks et al., 1995) have invoked Frijda's law of apparent reality when discussing how the reality status of media depictions may alter emotional responses. Frijda (2007) argued that information that is appraised as "real" has stronger emotional impact. By real he does not refer to objective reality status, but to *meanings* that are experienced as emotionally real. Factors that impact perceived realism include the extent to which a media depiction resembles reality, its plausibility, and its likelihood of occurrence in the real world. Children gradually come to understand these concepts, yet judging the reality status of media messages is complicated even for adults (Busselle & Greenberg, 2000; Cantor, 2009). Objectively unreal events may seem real because they are actually shown, especially when they resemble reality (Sparks et al., 1995). Both children and adults respond with greater fear to fictional violence that occurs in live-action programs than in cartoons or between puppets (e.g., Gunter & Furnham, 1984; Osborn & Endsley, 1971).

Judgments about plausibility, or whether fictional depictions could occur in real life, depend on personal beliefs and interpretations. Most older children and adults, for example, believe that vampires, werewolves, and zombies do not actually exist. Yet even seemingly impossible portrayals such as those on the television series *True Blood*, which features vampires and werewolves, share many features with real life, including interpersonal threats, violence, and death. These kinds of portrayals may remind viewers of threats that definitely do exist, and thus arouse fear that carries over into their lives (Cantor, 2009). From Frijda's (2007) perspective, the meanings of these depictions may be emotionally real. Moreover, the line between reality and fantasy is blurred, even for adults. Some people believe strongly in scientifically unsubstantiated supernatural or paranormal phenomena, and others are willing to consider that such phenomena may be real (Cantor, 2004; Sparks et al., 1995).

Real-world experience may influence estimates of probability or likelihood of depicted events, but aspects of media portrayals also play a role. For example, vivid and frequent depictions of rare dangers, such as shark attacks or kidnappings, can increase perceived probability of threats. Perceiving a threat as more likely should lead to a greater sense of vulnerability and fear, which may affect long-term risk perceptions (Loewenstein et al., 2001).

Finally, connections between media threat portrayals and people's own lives tend to increase perceptions of personal vulnerability. Geographical proximity influences

perceived susceptibility to threatening events, such as crime or natural disasters (Wise, Eckler, Kononova, & Littau, 2009). News reports of threatening events that happened nearby, especially those that are random and unpredictable, have been shown to evoke more fear than those that happened at a distance (e.g., Heath, 1984; Schlenger, 2004; Smith & Wilson, 2000). Perceived proximity of fictional threats also affects emotional responses. In a study of reactions to a scary televised narrative, children who believed that the depicted threat existed locally were more frightened than those who did not (Cantor & Hoffner, 1990). Finally, perceived similarity to people in frightening media portrayals – such as children exposed to news stories about child victims – can increase fear (e.g., Becker-Blease, Finkelhor, & Turner, 2008; Cantor & Nathanson, 1996).

Consequences of Fear Responses to Media

Emotion Regulation During Media Use

Emotions experienced during media use can motivate efforts at emotion regulation (Gross & Thompson, 2007; Lazarus, 1991). Although fear in the context of media use may be appraised as a positive experience (cf. Bartsch et al., 2008), fear is often experienced as aversive, or appraised as situationally inappropriate, such as when viewing a scary film with peers. Efforts to reduce fear during media use include attentional deployment (e.g., distraction or looking away), cognitive change (e.g., reappraising a threat as unrealistic), response modulation (e.g., suppressing fear expressions), and situation modification (e.g., asking a friend to coview). When fear is overwhelming, people sometimes choose to end exposure (Hoffner, 1995). Paradoxically, witnessing frightened characters may lead some individuals to continue attending to a media offering. Research shows that observing other people express fear (indicating vulnerability rather than threat) can motivate approach behaviors and prosocial responses (Marsh & Ambady, 2007). Hoffner (1995) found that adolescents who were higher in other-focused empathic concern tended to manage fear from scary films through reappraisal, whereas those who were higher in self-focused personal distress tended to use distraction. She argued that “people who experience empathic concern (and who worry about the characters) presumably would not want to risk missing the outcome of suspenseful events by distracting themselves” (p. 341).

Media use often occurs in the company of others, and new forms of technology are increasing opportunities for shared media experiences (Ducheneaut, Moore, Oehlberg, Thornton, & Nickell, 2008). The presence and reactions of other people can alter emotional responses by influencing appraisals of threat and coping potential (Manstead & Fischer, 2001) and by providing comfort and support (Burlison & MacGeorge, 2002). Studies have shown that media-induced fear motivates both children and adults to seek physical contact, and leads coviewers to offer comfort to distressed companions (Harris et al., 2000; Hoffner, 1995; Hoffner & Haefner, 1997).

Wilson and Weiss (1993) found that coviewing a scary program with an older sibling (compared to viewing alone) reduced preschoolers' self-reported fear, presumably because older siblings modeled minimal fear, made comments related to emotions, and offered nonverbal comfort. In contrast, in a study of children's past coviewing experiences, those who watched with older coviewers reported feeling more fear (Hoffner & Haefner, 1997). This finding is likely to reflect the selection of more frightening programs by older individuals. Together, these studies illustrate the complex ways that the social context of media use can influence fear.

Fear and Selective Media Exposure

Selective exposure to media may function, in part, as a means of regulating emotions initially elicited by media use (Bryant & Davies, 2006; Gross & Thompson, 2007). Media exposure has always been selective, but opportunities for information seeking and for using media to regulate emotions have increased exponentially with the advent of the Internet, the diffusion of digital video recorders, and the proliferation of mobile media.

Humans have a need to monitor their environment, especially during periods of crisis or danger. In threatening situations, information can reduce uncertainty, facilitate self-protection, and help reestablish a sense of control (Tooby & Cosmides, 2008). Thus, when faced with an external threat such as September 11, people may seek news exposure as a way of coping with stress or anxiety, even when those emotions were initially elicited by news coverage (Boyle et al., 2004; Hoffner et al., 2009). Information seeking is particularly likely among people who prefer to cope with anxiety by monitoring their environment, rather than by blunting emotion through avoidance or reappraisal. Sparks and Spirek (1988) found that, following the explosion of the space shuttle Challenger, individuals with a monitoring coping style were more likely to seek negative emotional news about the event, compared to those with a blunting coping style.

Messages that minimize danger or provide reassurance also can reduce fear and anxiety (Lazarus, 1991). Media-induced fear may motivate subsequent exposure to media content that is expected to provide relief or comfort, as well as avoidance of content with the potential to reinforce fear (Hoffner et al., 2009). For example, Wakshlag, Vial, and Tamborini (1983) found that people who felt apprehensive after watching a crime documentary were less likely to select films that featured high levels of victimization (based on synopses), and preferred films that showed the triumph of justice.

Finally, people might seek or continue exposure to frightening media if fear is seen as an optimal emotional state for achieving a future objective (Knobloch, 2003). Based on an instrumental approach to emotion regulation, Tamir and colleagues argued that people may be motivated to feel fear if they need to accomplish an avoidance goal (Tamir, Chui, & Gross, 2007; Tamir & Ford, 2009). For example, they found that people who were expecting to play a videogame that involved avoidance of threat (e.g., avoiding dangerous flying monsters), as compared to other goals, preferred to

listen to fear-inducing music before playing the game (Tamir & Ford, 2009). Based on this reasoning, people who believe that fear of particular social or environmental threats (e.g., immigration, global warming) will help them effectively engage in protective actions may seek repeated exposure to fear-related media messages (Conway, Grabe, & Grievess, 2007; cf. Lavine, Lodge, & Freitas, 2005).

Lingering Fear and Anxiety

Despite efforts at emotion regulation, fear responses to media can have emotional consequences that linger for days, weeks, and even years. Numerous studies show that enduring emotional reactions – ranging from nervousness, nightmares, and sleep disturbances to more prolonged feelings of anxiety and depression – are prevalent among children and adults (Cantor, 2009). Sparks et al. (1995) found that people with more vivid mental imagery experienced more lingering fear, possibly due to their ability to imagine that depicted threats could happen to them personally. Behavioral changes are also common, such as avoidance of activities or locations associated with media-induced fears (e.g., avoiding the woods after watching *The Blair Witch Project*; Cantor, 2004).

Cantor (e.g., 2009) argued that fear conditioning, which has been implicated in development of anxiety disorders such as specific phobias (LeDoux, 1996), may underlie the formation of long-term media-related fears. For example, after viewing *Jaws*, about shark attacks, people reported experiencing fear in objectively shark-free bodies of water, such as ponds or swimming pools (Cantor, 2004). Studies also have shown that exposure to news about terrorism, mass shootings, and natural disasters is related to long-term fears, and to symptoms of posttraumatic stress disorder among some individuals with no personal connection to the events (e.g., Fallahi & Lesik, 2009; Lau, Lau, Kim, & Tsui, 2006; Schlenger, 2004).

Fear and Risk Related to Real-World Threats

Media depictions that evoke fear may be linked to longer-term risk perceptions if they portray threats people expect to encounter later. Clearly the media depict a wide range of threats – related to health, crime, the environment, and many other domains – that are capable of generating fear and influencing risk perceptions. The concept of risk is defined in different ways by different scholars. But at its core, a risk refers to a threat that has some probability of occurrence. Risk perceptions are evaluations or appraisals of potential threats. Accordingly, risk perceptions are typically defined in cognitive terms, referring to estimates of the likelihood of encountering a threat (McComas, 2006). Greater perceived risk is associated with threats viewed as more likely to be personally experienced (susceptibility) and as having greater adverse consequences (severity) (Weinstein, 2000). A variety of other factors influence risk

perceptions associated with a threat, including controllability and familiarity (Slovic, Fischhoff, & Lichtenstein, 1980).

Relatively little is known about the link between risk perceptions and emotion (Loewenstein et al., 2001), but there is ample reason to suspect that media-related risk perceptions are closely tied to feelings of fear and anxiety. Emotion theory indicates that perceptions of greater threat likelihood and severity lead to greater perceived personal vulnerability and more fear (Ellsworth & Scherer, 2003; Weinstein, 2000). Recent emotion-based approaches to risk argue that factors such as vivid, emotion-laden threat portrayals may influence both perceived risk and emotional responses (Loewenstein et al., 2001; Slovic, Finucane, Peters, & MacGregor, 2004). Moreover, consistent with evidence of a reciprocal relationship between appraisals and emotion (Lazarus, 1991; Scherer, 2003), media-based risk perceptions and fear may be mutually reinforcing. Before discussing the role of fear in risk perceptions, a brief review of media influence on risk perceptions is provided.

Media Influence on Risk Perceptions

The media often inform individuals about threats to which they may be susceptible. Social amplification theory proposes that risks are defined for people by “amplifier stations” in society such as social groups or the media, which determine which risks are important and diffuse information about these risks (Kasperson, Kasperson, Pidgeon, & Slovic, 2003). Depending on how much attention is given to different threats, media sources can produce amplified or attenuated risk perceptions. The risk amplification function of the media may be partially explained by the availability heuristic premise, which contends that events that can be brought to mind more easily are perceived as more likely to occur (Tversky & Kahneman, 1974). Cognitive availability is associated with more frequent or recent activation (e.g., through media exposure) and with more vivid mental constructs. Moreover, the affect heuristic proposed by Slovic and colleagues (e.g., Slovic et al., 2004) suggests that emotions associated with risks may increase cognitive availability.

Studies show that people’s estimates of health, safety, and social risks are associated with greater reported exposure to news coverage of those topics (e.g., Coleman, 1993; Slater, Goodall, & Hayes, 2009; Slater & Rasinski, 2005). Slater and colleagues demonstrated that both exposure and attention to risk-related content are important in influencing risk perceptions. Exposure to media entertainment is also related to risk perceptions. For example, in a large sample of adolescents, Beullens and Van den Bulck (2008) found that reported exposure to music videos was related to lower perceived risk of speeding and drunken driving, whereas news viewing was related to greater perceived risk of those activities. Some evidence suggests that even one-time exposures to fictional programs can affect risk perceptions, although persistence of effects is not known (e.g., Cantor & Omdahl, 1991; Leiserowitz, 2004).

Cultivation theory also has been applied to media and risk perceptions (Gerbner & Gross, 1976; Morgan & Shanahan, 2010). Basically the theory contends that repeated exposure to patterns of television messages shapes people's perceptions of reality, so that heavier television users tend to see the real world as more similar to the world portrayed on television (Chapter 2). Cognitive accessibility and heuristic processing have been shown to underlie cultivation effects (Morgan & Shanahan, 2010). Most risk-related cultivation research has focused on crime and violence, but other risks such as those related to the environment have also been examined (Dahlstrom & Scheufele, 2010). Cultivation research has frequently confirmed that heavy television exposure, especially to news and crime dramas, is associated with greater estimates of real-world crime and violence, and higher perceived likelihood of being a crime victim (Morgan & Shanahan, 2010).

The media also shape risk perceptions by affecting how people think about threats. According to framing theory, media can alter how risk is perceived and interpreted by selectively focusing on some aspects of a threat rather than others (Scheufele, 1999; Chapter 3, this volume). Differences in the way a threat is presented can shape risk perceptions as well. For example, news stories that provide statistical data concerning the probability or severity of a risk have less impact on judgments than vivid risk exemplars, such as a story about an individual with first-hand experience (Zillmann & Brosius, 2000). Similarly, threats portrayed in entertainment programs that facilitate transportation and involvement with characters have a strong influence on personal risk perceptions (Green & Brock, 2000; Moyer-Gusé & Nabi, 2010).

The Relationship between Risk Perception and Media-Induced Fear

Clearly threats elicit fear and other emotions (Ohman, 2008), but only recently has research begun to uncover how emotions affect the way people process risks. Prompted by observations that people often neglect evidence such as probabilities when making risk-related decisions, scholars developed the "risk as feelings" approach that emphasizes the importance of emotions for risk perceptions and risk-related behaviors (Loewenstein et al., 2001; Slovic et al., 2004). This approach proposes that risk perceptions are a product of both how individuals cognitively assess risks and how they feel about them. There are several ways that fear responses to media may be related to risk perceptions. First, during media use, fear may increase attention to and evaluation of threat cues, and depending on the portrayal, lead to greater perceived severity or susceptibility (Cantor, 2009; Ohman, 2008; Weinstein, 2000). Second, if fear becomes linked to a particular risk, memory of the fear response may influence later judgments or decisions. Finally, repeated encounters with emotion-laden risk messages could reinstate and possibly intensify earlier fear responses, reinforcing a connection in memory. Slovic et al. (2004, p. 317) suggested that cogni-

tive availability “may work not only through ease of recall or imaginability, but because remembered and imagined images come tagged with affect.”

Research documents a link between fear or worry and reported long-term exposure to media coverage of specific risks (e.g., Dahlstrom & Scheufele, 2010; Van den Bulck & Custers, 2009). Lemal and Van den Bulck (2009), for example, found that women’s exposure to news about breast cancer was associated with greater fear of the disease, after controlling for several factors, including perceived personal risk. This outcome suggests that news may have impacted fear based on factors other than perceived susceptibility, such as perceived severity or ability to cope with the disease. A handful of studies grounded in cultivation theory has documented that media exposure cultivates fear of crime (e.g., Chiricos, Padgett, & Gertz., 2000; Eschholz, Chiricos, & Gertz, 2003; Holbert, Shah, & Kwak, 2004). For example, Eschholz et al. (2003) found that exposure to local news, reality TV, and crime drama was related to more fear of becoming a crime victim, especially among people who perceived that their neighborhoods had a high proportion of African American residents. Unfortunately, many studies that have claimed to study “fear of crime” have not measured any emotion-related responses (Morgan & Shanahan, 2010). Thus, relationships among media exposure, cultivated risk perceptions, and fear responses remain unclear. Nonetheless, evidence suggests that the media’s ability to cultivate risk perceptions is closely related to its ability to cultivate fear.

Studies have suggested that media influence on fear may occur, in part, through an influence on risk perceptions (e.g., Chiricos et al., 2000; Ferraro, 1995). The interpretation that perceived risk can lead to fear is consistent with the functional view of fear as a response to threat (Ohman, 2008). From this perspective, individual differences in threat perceptions and associated risk should play a role in evoking fear. For example, people vary in their perceptions of the severity of particular crimes and other threats, and their level of fear is partially a function of perceived severity (Warr, 1987). This illustrates the importance of appraisal processes in responding emotionally to mediated risks (Ellsworth & Scherer, 2003).

Emotions such as fear also exert a powerful influence on perceptions and judgments (Loewenstein et al., 2001; Scherer, 2003). Whereas positive emotions such as happiness can lower perceptions of risk, feelings of fear and dread have been shown to increase risk perceptions (e.g., Cantor & Omdahl, 1991; Dunlop, Wakefield, & Kashima, 2008; Lerner & Keltner, 2001). Media offerings that elicit self-referent emotions, such as fear for self, are particularly likely to affect perceived risk. For example, Cantor and Omdahl (1991) found that children who viewed frightening fictional portrayals of a house fire or a drowning subsequently were more worried about similar events happening to them, and also judged those events to be more likely, compared to dangers unrelated to those depicted.

If fear partially mediates the effect of media exposure on risk perceptions, this may help explain why more vivid, compelling media experiences – those capable of evoking the most emotion – have such a strong impact on individuals’ perceptions of those threats. Recent efforts to explain the influence of media narratives on risk

perceptions have provided striking insight into the underlying processes, but have relied primarily on cognitive explanations such as reduced counterarguing or lowered beliefs in personal invulnerability (e.g., Moyer-Gusé & Nabi, 2010; Slater & Rouner, 2002). Yet emotion is infused in the authors' descriptions of the narrative experience and the persuasive outcomes. Moyer-Gusé and Nabi (2010) argued that vicarious emotional experience is an important factor in facilitating the persuasive effects of narratives. Although they did not measure viewers' emotions beyond their involvement with the characters, who were dealing with an unplanned pregnancy, their framework strongly suggests that sharing the characters' emotions, such as fear or regret, may have contributed to a sense of personal vulnerability to unplanned pregnancy.

Behavioral Consequences of Risk Perceptions

People make risk-related choices every day when deciding where to go, what form of transportation to use, what food to buy, and so on. Many of these decisions are implicitly based on risk information conveyed by the media (Kasperson et al., 2003). Slovic et al. (2004) contend that people may give little thought to risks when making behavioral choices, unless risk perceptions are tinged with emotion, as they often are. Heightened risk perceptions, especially when accompanied by fear, can lead individuals to adopt behaviors to protect themselves or their loved ones from threat (Ohman, 2008; Tooby & Cosmides, 2008). A handful of studies have examined how media-cultivated crime perceptions lead to protective behaviors, and have implied (but not directly assessed) an important role for emotional response (e.g., Busselle, 2003; Nabi & Sullivan, 2001). For example, Nabi and Sullivan (2001) found a causal pattern in which TV exposure led to higher estimates of societal crime and violence, which resulted in greater intentions to take protective actions such as locking one's car door while driving or carrying a weapon. Of course, even when risk perceptions are accompanied by fear, individuals may still decide not to combat the perceived threat. Behavioral responses to threats are determined by other factors, such as the perceived efficacy of the response in addressing the threat and perceived self-efficacy (Lazarus, 1991; Witte, 1992). Thus, media messages that inform people about effective ways of coping may be more likely to prompt protective action.

Although fear that is relevant and appropriate can aid behavioral choices, Loewenstein et al. (2001) note that fear also can lead to disregard of objective risks, and to more risky (but less fear-inducing) choices, such as driving rather than flying to a distant destination. From the perspective of media influence, if media messages convey inaccurate information about risks, or contribute to heightened (excessive) fear through vivid and dramatic risk portrayals, then behavioral motivations may not correspond to actual dangers. A recent example is the drop in Measles–Mumps–Rubella (MMR) vaccinations in Britain (and subsequent increase in measles outbreaks) after extensive media coverage of a controversial study linking the MMR

vaccine with autism. The media gave relatively little attention to scientific evidence of the vaccine's safety, apparently stoking parental fear of a miniscule or nonexistent risk (Lewis & Speers, 2003).

An additional way of responding to risk is through information seeking, to obtain additional knowledge or reassuring information, as previously discussed. The Internet and mobile media have expanded up the possibilities for finding information related to risks, as illustrated by a study that explored Internet use during the anthrax scare in the United States in 2001 (Hobbs, Kittler, Fox, Middleton, & Bates, 2004).

Finally, perceived risk is an important factor in support for regulations or restrictions intended to contain or eliminate a threat. The psychometric paradigm developed by Slovic and colleagues (e.g., Slovic, 1987; Slovic et al., 1980) models how people subjectively define risk, and how their risk perceptions are related to their protective or regulatory actions. The paradigm includes two primary continuums related to how people define risk: dread (e.g., severe consequences, uncontrollability, catastrophic potential) and unfamiliarity (e.g., unknown, little scientific knowledge, delayed effect). Threats that are high on these continuums are more likely to prompt protective actions, which Slovic (1987) attributed to the deep anxieties people harbor about unknown and potentially catastrophic risks, such as nuclear power.

Media-Related Fear and Intergroup Relations

According to Kemper (2000, p. 46), "a very large class of human emotions results from real, anticipated, imagined, or recollected outcomes of social relations." Ohman (1986, 2008) contends that social threats are a major determinant of fear and anxiety in humans. One source of information about social relations is the media, which can influence how media users appraise others by varying the way various social groups and interactions are portrayed. When media portrayals frame different groups as threats, they can produce fear and anxiety in two ways: (1) they can lead people to fear members of groups portrayed as a threat; and (2) they can lead members of a group portrayed as a threat to feel fearful about responses from others. This section focuses on media-related fear or anxiety in the context of social perceptions and interactions.

Social identity theory focuses on how individuals define themselves as social group members, and examines evaluations or affect attached to those shared identities (Tajfel & Turner, 1986). To further explain social identity, Turner and colleagues developed self-categorization theory, which contends that when individuals perceive themselves as part of a social group, a process of depersonalization occurs and they cognitively redefine themselves in terms of that social group (Turner, 1999; Turner, Hogg, Oakes, Reicher, & Wetherell, 1987). Different social identities become more cognitively accessible depending upon the context, or as relevant stimuli for self-categorization change. People magnify their similarities to members of their own

social groups, and perceive greater differences between themselves and out-group members (Turner, 1999).

Grounded in social identity/self-categorization theory, intergroup emotions theory (Smith & Mackie, 2008) proposes that when people define themselves in terms of group membership, they appraise events from a group perspective rather than a personal perspective, which in turn affects their emotional experiences. Believing that another group poses a threat may lead to fear or other emotions, most notably anger. This is important, because fear and anger have distinct effects on subsequent appraisals, judgments, and behaviors. Fear leads to pessimistic judgments and risk-averse decisions, and is associated with desire to create distance from or avoid the out-group. Anger leads to optimistic judgments and willingness to take risks, and is associated with desire to confront or attack the out-group (e.g., Lerner & Keltner, 2001; Mackie, Devos, & Smith, 2000). In general, media depictions that portray various social groups as threats should impact emotions and behaviors of media users differently, depending on their group identifications.

Media and Fear of Other People and Groups

In addition to emphasizing violence and victimization, media offerings present a distorted view of *who* is likely to pose a threat to others or to society (e.g., Chiricos et al., 2000; Dixon, 2008). In their integrated threat theory, Stephan and Stephan (2000) argue that negative attitudes towards out-groups are largely a function of perceived threats associated with out-group members. According to the theory, these threats include (1) realistic threat to the well-being of the in-group (e.g., threats to physical safety or economic resources), (2) symbolic threat to the in-group's values or world views, (3) intergroup anxiety, related to awkwardness or uneasiness about interacting with out-group members, and (4) negative stereotypes, leading to negative expectations about the behavior of out-group members. Following the logic of integrated threat theory, the media have the potential to create fear by depicting particular groups as threats (Vergeer, Lubbers, & Scheepers, 2000).

Sometimes media messages explicitly indicate that particular groups pose a threat. Conway et al. (2007) found that television host Bill O'Reilly regularly uses fear frames in his commentary. Their analysis showed, for example, that O'Reilly positions groups such as "illegal aliens" and "foreigners" as a physical threat to US citizens, in part by framing them as villains and discussing how they outnumber US citizens. But media indicators of who poses a threat are often less direct, and require that media consumers draw inferences based on patterns of media content. The news media disproportionately focus on crimes committed by people in particular social groups, such as African Americans, Latinos, and Muslims, and entertainment media suggest that members of these groups are typically violent criminals or terrorists (Chapters 12, 13; Dixon, 2008; Nacos & Torres-Reyna, 2007;

Oliver, 2003). Immigrants to the United States are often portrayed in a negative light, and are framed as posing economic and cultural threats (Brader, Valentino, & Suhay, 2008). Members of other social groups have also been painted as a threat by the media. For example, news and entertainment media often show people with mental illness as dangerous, violent, or unpredictable (Stout, Villegas, & Jennings, 2004; Wahl, 2006).

Media portrayals that depict particular social groups as threatening can lead people to experience fear or anxiety associated with members of those groups (Nacos & Torres-Reyna, 2007; Oliver, 2003; Vergeer et al., 2000; Wahl, 2006). Fear motivates self-protection (Ohman, 2008), and can impact behavior even if people “know” their emotional response is not based on rational evidence (Slovic et al., 2004). Media-induced fear of particular social groups may lead to consideration of how the threat from those groups can be eliminated or avoided in the future (cf. Baumeister et al., 2007). One possible outcome is that individuals may try to reduce or avoid contact with members of groups portrayed as threatening (Lee, Weil, & Shihadeh, 2007; Wahl, 2006). Media portrayals may also promote biased and discriminatory behavior towards members of these groups. Individuals who feel at risk may support public actions they perceive as protective, for example by endorsing public policies related to crime or immigration (Davis & Gandy, 1999; Fujioka, 2005). Importantly, fear of out-groups appears to be a motivating force driving these behaviors. For example, in a study with White participants, Brader et al. (2008) found that exposure to news coverage of Latino immigrants, but not European immigrants, was associated with greater support for anti-immigration policy and related behaviors (e.g., information requests and emails to Congress), in part due to anxiety responses to the news depictions. Their evidence suggested that this outcome depended not on the threat of immigration, *per se*, but on *who* the immigrants were; anxiety related to Latino immigrants directly influenced behavior.

As already noted, intergroup threats may elicit both fear and anger, depending on the circumstances. News coverage of September 11 highlighted the threat of terrorism, and also identified the perpetrators of the attacks as Arab Muslim individuals. In a survey soon after the events, Skitka, Bauman, Aramovich, and Morgan (2006) found that both fear and anger were common responses among US citizens, but that these emotions were differentially related to response preferences. Fear was associated with greater support for deporting Arab Americans, Muslims, and first generation immigrants from the United States, whereas anger was associated with greater support for war.

Despite the media's role in reinforcing fears of out-groups, some evidence suggests that media offerings can also reduce fear and anxiety by offering positive mediated intergroup contact (Schiappa, Gregg, & Hewes, 2005). For example, Muller (2009) found that watching a drama in which people from different cultural backgrounds interacted and resolved differences led people to see out-group members as less threatening. However, this outcome was observed primarily for individuals who identified with out-group characters while viewing.

Threat and Anxiety Related to Expected Influence of Media on Others

Media depictions can also elicit fear and anxiety in people whose groups are stereotyped as threats by the media. When people see media representations of similar others, this can “cue” their social identity, making them more responsive to messages that are relevant to their activated identity. For example, when African Americans are exposed to mediated images of their ethnic group, their awareness and sensitivity to other media portrayals of their group increases (Davis & Gandy, 1999; Fujioka, 2005). This heightened consciousness can translate to anxiety if individuals believe media depictions of their group are negative. Fujioka (2005), drawing from integrated threat theory, argued that perception of negative media portrayals of one’s own group fit the criteria for a perceived threat that needs to be combated. In addition to integrated threat theory (Stephan & Stephan, 2000), several theoretical approaches are relevant to understanding people’s responses to negative media depictions of their own group – for example, being portrayed as a threat to others – and expectations about how other people will be influenced by these depictions. These approaches include stereotype threat theory (Steele & Aronson, 1995), the related concept of collective threat (G. L. Cohen & Garcia, 2005), and the influence of presumed media influence model (Gunther & Storey, 2003; Chapter 5, this volume).

Stereotype threat theory contends that individuals are often aware of negative stereotypes about their group and are fearful of behaving in ways that support the stereotypes. A prerequisite for experiencing stereotype threat is believing that others are likely to apply a stereotype in their interpersonal actions or attributions about one’s group. Thus, stereotype threat is thought to be laden with anxiety, which can influence performance (Shmader, Johns, & Forbes, 2008). Studies have shown that television gender stereotypes can activate stereotype threat for women in relation to their math and science ability (e.g., Davies, Spencer, Quinn, & Gerhardstein, 2002). G. L. Cohen and Garcia (2005) introduced the concept of collective threat, defined as the fear that stereotype-conforming actions of in-group members will adversely influence how they are viewed by others. Media exposure to stereotype-consistent depictions of in-group members can remind people of group stereotypes, and has the potential to activate collective threat (Fujioka, 2005; Richeson & Pollydore, 2002; Stuart, 2006). Research on the impact of stereotype threat, and the newer concept of collective threat, has focused on consequences for academic and intellectual performance, but the effects are not limited to these domains. Recent studies have found that intergroup interactions are affected by stereotype threat related to race (Goff, Steele, & Davies, 2008) and mental illness (Henry, von Hippel, & Shapiro, 2010). It seems likely that media portrayals can make threat-related group stereotypes more salient for members of stereotyped groups, leading to expectations that others will rely on those stereotypes in personal and social contexts (Fujioka, 2005). Such responses may contribute to anxiety, anticipated rejection, and even avoidance of intergroup contact (cf. Shelton & Richeson, 2005).

Stereotype threat and collective threat related to media portrayals may be particularly strong because people tend to believe others will be swayed by stereotypic media depictions of their group. Much research documents that people believe media messages have a greater influence on others than on themselves, and that these perceptions have behavioral implications (Perloff, 2009). Gunther and Storey (2003) contended that indirect effects of media operate via a process they called the influence of presumed influence. They stated: "People perceive some influence of a message on others and then react to that perception of influence" (p. 201). In other words, people's responses to media depend, in part, on how they perceive others are affected, independent of any perceived effect on themselves. In a study in Nepal, Gunther and Storey found that the presumed influence of a radio drama on healthcare providers affected clients' perceptions of and interactions with the health workers.

Perception of negative and misleading media images of one's own group can make people feel vulnerable because they believe that others are less capable of critically evaluating those images. As a result, they tend to be fearful that others will be swayed by these media messages, and will develop stereotypes of their group (Hoffner, Fujioka, Cohen, & Atwell-Seate, 2008; Tsfat, 2007; Tsfat & Cohen, 2003). For example, Tsfat (2007) found that feelings of alienation experienced by Arab individuals in Israel were related to perceived negative media coverage of their group and the presumed influence of that coverage on out-group audiences.

Presumed media influence can translate into behavioral responses. Gunther, Perloff, and Tsfat (2008) classify behavioral consequences of presumed media influence into two types, prevention and accommodation. *Prevention* is exemplified by support for media restrictions to protect others from perceived harmful effects, and has been well documented (Perloff, 2009). Of several types of *accommodation*, fear and anxiety about the media's influence on others seem most likely to motivate withdrawal responses, such as not doing something that is expected to lead to social rejection or isolation. For example, in a study of residents of "development towns" in Israel, Tsfat and Cohen (2003) found that the more residents believed that media coverage had led to negative public attitudes toward the towns, the more likely they were to consider moving elsewhere. Using the influence of presumed influence framework, and considering the role of emotion in behavioral responses, should lead to a more complete understanding of the consequences of mediated group stereotypes.

Conclusions and Interpretations

This chapter has argued that media-related fear can exert a powerful influence over perceptions, expectations, and behavior. Applying the concept of mediated threat and associated fear responses to three contexts – immediate responses to media, risk perceptions, and intergroup relations – has yielded a more comprehensive understanding of the role of fear in media uses and effects. Yet although much theory and research supports the arguments presented, the review has also uncovered gaps in

our knowledge. Scholars need to give greater attention to emotion in the study of media, considering the role of specific emotions as well as general indicators of emotional involvement (cf. Nabi, 2010). As others have argued, much research related to risk perceptions and intergroup relations reflects a bias toward cognitive explanations, which provides an incomplete picture of media influence (Brader et al., 2008; Loewenstein et al., 2001; Slovic et al., 2004). Another issue is that fear or risk perceptions are often measured shortly after media exposure, leaving open the possibility that these responses decrease over time if not reinforced. Likewise, fears attached to identity (e.g., stereotype threat) may lie dormant until activated by later events or situations. The role of individual differences such as group identity in responses to mediated threats also needs to be explored in greater depth. A more general challenge for media scholars is to develop models that consider the likely reciprocal relationship between threat perceptions and fear, as well as how these responses lead to complex behaviors.

There is also a need to understand how fear responses to media depictions are affected by and interact with other emotions (cf. Lerner & Keltner, 2001). Theories of emotion have begun to account for the possibility that different emotions – even those of opposite valence – can occur simultaneously (Ellsworth & Scherer, 2003). Future research should study media-related fear in the context of other emotions, which should reveal a more complete picture of how individuals respond to mediated threats.

Although individuals are becoming increasingly reliant on the Internet and mobile media, surprisingly little is known about the unique abilities of these technologies to convey threat information and evoke fear responses (McComas, 2006). Mobile technologies are making it easier for individuals to stay connected to news and other information sources, and to share information with others. But increased access to social networks could potentially enhance fear and anxiety by increasing the speed at which partially accurate or inaccurate information spreads (Ma, 2008). Newer forms of media such as social networking sites and Internet forums extend offline relationships and facilitate the development of new contacts, but also provide alternative contexts for social threats and fears related to interpersonal and intergroup communication (Douglas, 2008). In summary, a great deal is known about the role of fear in response to mediated threats, but there is still much to be learned, and rapid changes in media technologies offer challenges and possibilities for media scholars.

Callous/Malice

An Examination of Desensitizing and Aggression-Causing Media Effects

Ron Leone and Angela Paradise

ABSTRACT

This chapter explores the complex relationship between exposure to media violence, aggression, and desensitization across various effects dimensions, from physiological and cognitive to affective and behavioral. The impact of contextual factors of media violence is explored, supported by a discussion of Leone's work on "ratings creep." Susceptibility to media violence is also discussed, informed by Paradise's videogame research dealing with trait aggression and playing style. The authors conclude that the relationship between exposure to media violence, aggression, and desensitization is not linear. Short-term increases in responsiveness to violent media – suggesting aggression-causing effects – can cede to decreased responses – indicative of a desensitization effect – over time. It is this pattern, the authors assert, that is most likely to guide future research into these phenomena.

Key Outcomes of Media Violence

Startling statistics have been published on the number of violent and aggressive acts committed in the United States. According to the FBI (2010), more than 1.3 million violent crimes (e.g., murder, forcible rape, robbery, and aggravated assault) occurred

The International Encyclopedia of Media Studies, First Edition.

in the United States in 2009. That same year, the Bureau of Justice Statistics (2009), which collects data on reported and unreported crime from the victim's perspective, measured approximately 4.3 million nonfatal violent victimizations of people age 12 or older. The Centers for Disease Control (CDC) (2008) reported that homicide continues to be the second leading cause of death for youth ages 10- to 24-years-old. Meanwhile, nationwide surveys found that nearly 20% of students reported being bullied on school property (CDC, 2010) and over 70% of teenagers have been "cyber-bullied" within the last school year (Juvonen & Gross, 2008).

What factors contribute to the wide range of violent and aggressive acts that pervades the United States? To be clear, most social scientists agree that no single variable causes a person to engage in violent or aggressive behavior. Rather, a host of factors, including psychological and cognitive impairments, parental upbringing, drug use, and access to weapons has been linked to real-world violence and aggression. Yet, we must also consider our media landscape, which, as the title of our chapter indicates, is permeated by malicious acts of violence committed by television, film, and videogame characters, often portrayed as callous and indifferent to the suffering of their victim(s). Historically, many scholars have investigated the connection; Murray (2008; Chapter 10) identified nearly 600 correlational and experimental studies directly pertaining to television and film violence over a 50-year period. Although there are some critics who disagree (e.g., Fowles, 1999; Freedman, 1984), most reviews of this research (e.g., Potter, 2008) conclude that violent screen media can increase the likelihood that a viewer or player will think, feel or behave aggressively, as well as experience physiological arousal and exhibit decreased prosocial behavior.

Another negative outcome of media violence exposure – desensitization – is also becoming increasingly prevalent in the literature. Desensitization refers to lowered responsiveness to a negative stimulus (typically screen media) after repeated or prolonged exposure to it, often referred to as habituation (Cline, Croft, & Courier, 1973). This outcome has been conceptualized as a short-term, immediate reduction in sympathy or concern (Drabman & Thomas, 1974), and as a long-term, cumulative effect caused by repeated exposure to media violence (Thomas, 1982). From what Carnagey, Anderson, and Bushman (2007) call desensitization "processes" (e.g., decreased heart rate) to desensitization "effects" (e.g., empathy for victims of violence), research in this area has not garnered the attention aggression has. However, we argue that desensitization is an equally important outcome to study. In fact, some scholars believe that desensitization may be a far more pervasive effect than aggression; further, as we will address in greater detail, some research suggests that desensitization to media violence can influence reactions to real-world aggression (Thomas, Horton, Lippincott, & Drabman, 1977).

This chapter will focus on the outcomes of aggression and desensitization as they relate to media violence. We will examine the various ways researchers have measured the effects of media violence and structure our chapter by the physiological, cognitive, affective, and behavioral outcomes associated with aggression and desensitization. Next we will address the types of violent media content (i.e., the contextual portrayals) that

can heighten the likelihood of desensitization and/or aggressive responses, as well as consider the individual difference variables (e.g., age, gender, etc.) that can increase a person's susceptibility to the effects of media violence. We will conclude this chapter by considering the social significance of aggression and desensitization.

Physiological Outcomes

Researchers have long measured physiological arousal (e.g., heart rate, blood pressure, skin conductance, respiration changes, etc.) during or immediately following exposure to violent or suspenseful media. Investigations of television and film have found that violent messages, as well as sexual depictions, lead to increases in viewers' physiological arousal. Early research by Osborn and Endsley (1971) found that children's galvanic skin response (GSR) levels (i.e., "emotional sweating") were significantly higher when watching violent cartoons and live-action scenes when compared to nonviolent content. Likewise, Groer and Howell (1990) measured the heart rates and skin temperatures of preschool children while they viewed clips of the nonviolent, slow-paced program, *Mister Rogers*, and the verbally and physically aggressive, fast-paced program, *GI Joe*. The researchers found that when compared to watching *Mister Rogers*, the heart rates of children watching *GI Joe* were significantly higher.

While the aforementioned studies examined arousal in young children, more recent research has investigated the effects of arousal-inducing television and film content among older audiences. For example, Kalamas and Gruber (1998) examined the electrodermal responses of 10- to 15-year-olds exposed to clips of the film, *Friday the 13th*. The study found a significant increase in participants' physiological reactivity, and responses were stronger during scenes of implied or impending violence (e.g., the perpetrator approaching his victim) when compared to scenes of actual violence (e.g., the perpetrator stabbing his victim). These findings suggest that the suspense leading up to a violent act may be just as arousing, if not more so, than watching a violent act depicted on the screen.

In recent years, researchers have directed their attention to the arousal-inducing effects of violent videogames, with findings largely pointing to an increase in physiological outcomes. For example, Ballard and Wiest (1996) randomly assigned participants to one of three exposure groups: a highly violent version of *Mortal Kombat* (with blood), a less violent version of *Mortal Kombat* (without blood), and a nonviolent control game, *Corner Pocket*. Participants who played either version of *Mortal Kombat* showed significantly higher cardiovascular reactivity scores (measured by heart rate and systolic blood pressure) than those in the nonviolent condition; further, heart rates and blood pressure scores were significantly higher for those who played the more violent game compared to its less violent counterpart. These findings suggest that videogame violence can increase players' arousal, and that the physiological outcomes can increase with heightened violent content.

In a similar study, Fleming and Rickwood (2001) examined the relationship between violent videogame play and children's physiological outcomes by randomly assigning participants to play a paper-pencil game, a nonviolent videogame, or a violent videogame. Results showed that the children's heart rates and self-reported arousal increased significantly after playing the violent videogame when compared to the other game conditions, with females experiencing greater increases than males.

Despite these findings, some recent research, using the most technologically sophisticated games, suggests that violent content in videogames may be just as arousing as other game elements (e.g., pace, perceptual persuasiveness of graphics, screen size, etc.). For example, Ivory and Kalyanaraman (2007) randomly assigned participants to either a newer or older version of a violent or nonviolent videogame to test players' levels of presence, involvement, physiological arousal, self-reported arousal, and aggression (cognitive and affective). While the technological advancement of newer games increased players' physiological arousal (as measured by skin conductance) and self-reported arousal, there was no support for the researchers' prediction that those in the violent videogame condition would experience greater arousal than those in the nonviolent game condition. Likewise, Barlett, Rodeheffer, Baldassaro, Hinkin, & Harris (2008) failed to find a significant difference in physiological arousal between players of a violent and nonviolent videogame; they attribute this finding to the fact that the games tested in their study were equally exciting. Given these findings, we concur with Ivory and Kalyanaraman (2007) that future research should investigate the effects of content elements (e.g., violence) in concert with other game features (e.g., technological advancement) to better comprehend these variables' relative contributions to physiological arousal and other aggression-related outcomes.

Finally, expanding on the research on physiological outcomes, neuroscientists have charted new territory by studying media violence exposure and brain activation patterns. Using MRI technology, Murray et al. (2006) are investigating children's brain activity while watching violent television (see Chapter 10). At the same time, videogame researchers, such as Weber et al. (2006), have employed similar research designs, with preliminary evidence suggesting that playing violent games is strongly related to brain activity patterns characteristic of aggressive thoughts. While these studies are exploratory and limited by small samples, they provide an innovative foundation from which future neuroscientific research can grow.

Overall, the body of research on screen media suggests that exposure to violent content can lead to subsequent increases in short-term arousal. As noted by Anderson et al. (2003), these findings are especially noteworthy in light of evidence that increased arousal levels can heighten the likelihood of aggressive behavioral responses. In line with excitation transfer theory (Zillmann, 1991), arousal caused by media content (violent or nonviolent) may be misattributed as anger in situations involving provocation and in turn may increase the likelihood of anger-motivated aggressive behavior. In other words, heightened levels of short-term physiological arousal can have subsequent effects on aggression.

While exposure to media violence can indeed increase physiological arousal, researchers have long studied the way in which these responses can subside over time, with individuals' lowered responsiveness to media violence along various physiological measures indicating they are becoming desensitized to media violence after repeated exposure. Researchers have measured differences in physiological responses to exposure to violent media once (Bartholow, Bushman, & Sestir, 2006; Cline et al., 1973) or multiple times (Ballard, Hamby, Panee, & Nivens, 2006). More frequently, researchers exposed subjects to media violence and measured their subsequent physiological responses to a variety of alternate stimuli (Ballard et al., 2006; Linz et al., 1989; Thomas et al., 1977).

In an early study detailing results of two experiments, children who reported being heavy TV viewers had lowered GSR and blood volume pulse amplitude when viewing a violent film (Cline et al., 1973). More recently, adult males who enjoyed and frequently played violent videogames demonstrated different brain activity than men who enjoyed and played them less often (Bartholow et al., 2006). The amplitude of frequent violent game players' P300 event-related brain potential (ERP), which corresponds to aversive reactions to negative (e.g., violent) visual stimuli, was lower than infrequent violent game players' measures, in response to neutral, violent, and negative nonviolent images from Lang, Bradley and Cuthbert's (2001) international affective picture system (IAPS) (Bartholow et al., 2006). Epistemologically, Bartholow et al. (2006) advanced the study of desensitization, in part, by using neutral, violent, and negative nonviolent images from the IAPS in lieu of fictional violence from a Hollywood film. Where Cline et al. (1973) made a theoretical leap from TV exposure to TV violence exposure, Bartholow et al. (2006) had subjects complete a questionnaire regarding favorite videogames and perceived violence within when comprising high- and low-exposure groups. Bartholow et al.'s (2006) primary contribution to desensitization literature was their measurement of a specific brain reaction to stimuli, adding an additional physiological indicator to existing measures. These researchers examined short-term desensitization effects, relying on self-reported prior exposure (assumed or actual) to media violence as an antecedent to physiological responses.

More often, researchers expose subjects to media violence and measure physiological desensitization to subsequent stimuli. Thomas et al. (1977) showed subjects a violent police drama or nonviolent sports film and measured GSR during a subsequent real-world depiction of screen violence; those who previously viewed violence had lower GSR. Males in Linz, Donnerstein, and Adams's (1989) study exposed to "slasher" films had lower heart rates during the final part of violent clips they were exposed to than males who previously viewed nonviolent scenes. Ballard et al. (2006) measured adolescents' heart rate, systolic blood pressure, and diastolic blood pressure while playing violent or nonviolent videogames, and found lowered responses in all three areas not only during game play but across time (from Time 1 to Times 2 and 3); however, the pattern was not exclusive to players in the violent game group. Similarly, male subjects who played a high- or low-violence version of a first-person

shooter game for 20 minutes had lower heart and breathing rates over time. In the same study, those who played the high-violence version had lower GSR responses to subsequent exposure to “aversive” IAPS photos (e.g., mutilated corpses) (Staudemüller, Bliesener, & Luthman, 2008).

Ballard et al. (2006) assessed adolescents’ physiological desensitization to violent and nonviolent, active videogames (a) within a 15-minute session and (b) over the course of 3 weekly sessions. Measuring heart rate, systolic blood pressure, and diastolic blood pressure, their results were mixed. Within their gaming session, subjects relaxed, but did not demonstrate steadily decreasing cardiovascular responses. Further, no difference in responses between the violent and nonviolent games was found. Over the course of three weeks, subjects demonstrated decreased physiological responses; again, no differences in responses between violent and nonviolent games were detected. The authors concluded that arousing, but not necessarily violent, games invoked such responses (Ballard et al., 2006).

A crucial aspect of desensitization research is whether the pattern of reduced physiological responses found in most of these studies means individuals will care less or have blunted reactions when exposed to real-world violence. Yet, due to ethical considerations, researchers do not expose participants to actual violence, settling instead for mediated violence presented as real, such as actual news footage or staged conflicts. While operationalization of real-world violence varies, in general, it refers to depictions not created by Hollywood studios for entertainment purposes (Carnagey et al., 2007). Thus, the common trait shared by all content used as real-world examples is that it is mediated. Care should be taken not to mistake desensitization to real-world *media* violence for desensitization to real-world violence.

Thomas et al. (1977) measured subjects’ skin resistance during exposure to real-world violence after viewing violent or nonviolent arousing media. In experiment 1, children watched either an excerpt from a violent television police drama or a volleyball game, followed by a staged violent confrontation between two preschoolers caught on camera. Subjects who watched the violent police drama exhibited lower GSR responses to the real-world violence (i.e., the staged preschooler conflict) than control subjects. Experiment 2 was similar, except for the sample population (college undergraduates) and the real-world violence stimulus (unedited news footage of riots outside the 1968 Democratic National Convention in Chicago). Male subjects followed the predicted pattern (lowered GSR responsiveness); the results were more tentative for females. Carnagey et al. (2007) measured college students’ heart rates and GSR before and after playing either violent or nonviolent arousing videogames for 20 minutes. Their physiological responses were measured as they watched a 10-minute videotape of real-world violence (e.g., courtroom outbursts, prison fights). As predicted, subjects who played one of the violent videogames demonstrated lower physiological responses to the violent clips. Recall that high-violence game players in Staudemüller et al.’s (2008) study had lower GSR responses to aversive IAPS photos; they were also more physiologically sensitive to the aggressive photos, as predicted, which was attributed to a priming effect of the violent videogame.

Thus, in terms of physiological desensitization, questions persist regarding different responses to violent versus active (but not necessarily violent) stimuli, especially as researchers have focused on the effects of violent videogame playing on individuals. Habituation over the course of single and multiple exposures remains a primary emphasis, as does its relationship to subsequent responses to a variety of stimuli, including real-world media examples (themselves often presented in a mediated, though ostensibly non-fictional, context). There is evidence to suggest that violent entertainment media use makes subsequent exposure to violence presented as having actually occurred, less physiologically arousing to research participants.

Cognitive Outcomes

Aggressive cognitions as an outcome of exposure to media violence have been measured in a variety of ways (e.g., word-completion tasks, thought-listing tasks, and word-reaction time tasks), with studies providing evidence of short-term aggressive thoughts following exposure to media violence. For example, Chory-Assad (2004) found that exposure to verbally aggressive TV sitcoms led to an increase in participants' aggressive thoughts. Research on violent movies (Anderson, 1997) and photographs of weapons (Anderson, Benjamin, & Bartholow, 1998) yielded similar results. In the past, researchers of television and film violence (see Chory-Assad, 2004) also applied thought-listing tasks in their research design, and recently videogame scholars have drawn on this measurement tool as well. For example, Tamborini et al. (2004) found that participants who played a violent videogame listed significantly more hostile thoughts than subjects in a nonviolent control group. Anderson and Dill (2000) found that even brief exposure to violent videogames can heighten aggressive thoughts, as measured by a reading-reaction time test. Likewise, Anderson et al. (2004) found that participants who played a violent videogame produced a significantly higher percentage of aggressive words (using a word-completion task) than those in the nonviolent videogame group. However, in a similar study by Cicchirillo and Chory-Assad (2005), aggressive thoughts were not observed among participants who played a violent videogame for 10 minutes. The researchers posit that "perhaps aggressive thoughts are not primed until violent videogames are played for longer periods of time, maybe long enough for players to learn the game and get comfortable playing it" (p. 446). This comfort may in fact be an indicator of desensitization over time.

Measuring cognitive effects in desensitization research often takes the form of perceptions of victims. Linz and colleagues (1989) had subjects view violence against women or arousing, nonviolent content, followed by scenes of men committing acts of violence against women. Participants then assessed perpetrators' and victims' levels of responsibility, levels of violence and victim injury, and victims' attractiveness. Subjects in the violence-viewing group judged the female victims as less injured

than did controls; however, they also attributed more responsibility to the perpetrators, a finding the authors described as a possible short-term, sensitizing effect of violence viewing.

Linz, Donnerstein, and Penrod (1984) explored the desensitizing effects of multiple exposures to violent content. On successive days, male subjects viewed "R-rated" violent films containing violence against women in which the female victims are not sexually aroused by the violence and usually end up murdered. On the final day, subjects and members of a control group watched a reenactment of an actual rape trial. Over the course of five days, subjects judged the films as being less degrading to women and less violent. Compared to the control group, subjects also deemed the rape victim in the reenactment as less injured and less worthy of sympathy, leading Linz et al. (1984) to conclude that regular exposure to media violence may reduce sensitivity to victims in other contexts.

Mullin and Linz (1995) explored "spillover" desensitizing effects of sexually violent material, again looking at the impact of viewing slasher films on men's evaluations of domestic violence victims. They sought to determine the persistence of desensitization by having subjects evaluate victims three, five, or seven days after the final exposure. Cognitively, subjects' estimates of the sexual violence in the films decreased over time. Moreover, subjects who evaluated victims three days after seeing the final film perceived less injury than those in the five-day later, seven-day later, and control groups, suggesting a recovered sensitivity on the part of subjects over an extended period of time.

Clearly, evidence suggests that time plays an important role in determining cognitive effects, whether it's during a single exposure to media violence or over the course of multiple exposures to it. The provocation and subsequent subsiding of aggressive thoughts related to media violence exposure suggest a pattern seen less steadily in the realm of affective responses.

Affective Outcomes

Whereas cognitive outcomes involve thoughts and information processing, affective outcomes embody emotions such as fear and anger. Research on television and film has shown that exposure to violence can contribute to feelings of hostility, anxiety, fear, and depression. However, the research on playing violent videogames and aggressive affect is less consistent, with some studies finding a significant relationship (e.g., Ballard & Wiest, 1996; Carnagey & Anderson, 2005; Gentile, Lynch, Linder, & Walsh, 2004) and others showing marginal to no support (e.g., Anderson & Dill, 2000; Scott, 1995).

In a series of experiments, Carnagey and Anderson (2005) explored the effects of rewarded and punished violent acts during videogame play on subsequent aggressive affect, investigating whether aggressive behavior is driven by cognition or affect; i.e., when comparing aggressive thoughts to aggressive affect, which is more likely to

influence aggressive behavior? They found that videogame violence, regardless of whether it is rewarded or punished, significantly increased hostile emotions relative to playing a nonviolent game. However, their findings, when compared to their other two experiments testing the outcomes of cognition and behavior, suggest that aggressive cognitions are more likely than aggressive affect to drive aggressive behavior.

While experimental and correlational data provide evidence of a significant link between violent videogame exposure and aggressive affect, other research paints a different picture. Scott's (1995) hypothesis of a linear increase in aggressive affect after playing a non-aggressive computer game (*Tetris*), a moderately aggressive computer game (*Overkill*), or a very violent computer game (*Fatal Fury*), respectively, failed to gain support. Anderson and Dill (2000) found that playing a violent videogame failed to significantly increase state hostility; however, violent videogame play significantly increased aggressive cognitions and aggression behaviors relative to players in the nonviolent game condition. In light of these findings, Anderson and Dill suggest that the effects of violent videogames may take "a cognitive and not an affective path to increasing aggressive behavior in short-term settings" (p. 786), but "do not rule out the possibility that under some circumstances violent videogame effects on subsequent aggressive behavior might be mediated by increased feelings of hostility or by general arousal effects" (p. 788).

Affective and attitudinal desensitization, typically operationalized in the form of sympathy for victims, is a frequent research focus. Recall the work of Linz et al. (1989), who took measurements of the moods (hostility, anxiety, and depression) of males who viewed violence, immediately after viewing and again after seeing the dependent measure clips. They found that exposure to violence had a short-term desensitizing effect on mood. Controls experienced increases in the three mood measures after viewing the violent clips, whereas experimental subjects did not (Linz et al., 1989).

In 1988, Linz, Donnerstein, and Penrod had male subjects watch either two or five slasher, "X-rated," or less explicit teen sex films, then view and evaluate a reenactment of either an acquaintance or nonacquaintance rape trial. Linz et al. (1988) predicted lowered responsiveness from subjects who viewed the sexual violence in the slasher films than those who saw nonviolent, sexual content, as well as differences in responses to the reenactments. Over time, sexually violent material that initially provoked negative affective responses (e.g., anxiety) in subjects subsided. Violence-viewing subjects were less sympathetic to the rape victim in the trial, and less able to empathize with rape victims in general than other subjects and controls. However, longer exposure periods were needed to affect the latter response. In subsequent work exploring the effects of multiple exposures to violence over time, subjects in Mullin and Linz's (1995) study became desensitized by viewing three slasher films in five days, displaying decreased hostility, but not anxiety or depression.

More recently, Fanti, Vanman, Henrich, and Avraamides (2009) examined short-term desensitization effects by showing subjects nine violent and nine comic scenes (alternating) and having subjects assess enjoyment of all eighteen and sympathy

toward victims in the nine violent clips. Using latent growth-curve modeling, Fanti et al. (2009) discovered divergent curvilinear paths for enjoyment and perceived victim sympathy during violent scene viewing. Over the course of multiple exposures to violence in the short-term, subjects' enjoyment started at a midpoint on the researchers' scale, decreased at first, and at clip five began a steady escalation culminating in highest levels of enjoyment for the ninth violent clip. Victim sympathy also began at a midpoint on the researchers' scale, increased at first, and at clip five began a steady decline paralleling the increases in perceived enjoyment. Fanti et al.'s (2009) work suggests that short-term desensitization effects are not always linear, as has been found in the past, but also can be curvilinear. The pattern of increased sympathy and decreased enjoyment evident by the midway point of their experiment provides some evidence for the possibility of short-term sensitization that may coexist with more conventional desensitization findings.

Funk, Bechtoldt Baldacci, Pasold, and Baumgartner (2004) assessed long-term desensitization effects of media violence on children through survey methodology. They assessed relationships between real-life and media violence exposure and desensitization, predicting lower empathy and stronger proviolence attitudes among children who report greater exposure levels, especially regarding videogame violence. Exposure to videogame violence was associated with lower empathy and stronger proviolence attitudes. Movie violence exposure was also associated with stronger proviolence attitudes. However, real-life violence exposure did not correlate significantly with either measure. Yet, their correlational survey data do not rule out the possibility that individuals with more proviolent attitudes and less empathy seek out more violent media rather than the violent media necessarily causing the proviolent attitudes or lack of empathy.

Funk, Buchman, Jenks, and Bechtoldt (2003) examined short- and long-term desensitization effects, focusing on relationships between children's exposure to videogame violence and their empathy, game preference, and attitudes toward violence (components of moral evaluation). To assess short-term effects, Funk et al. (2003) examined children's empathic responses to vignettes after playing a violent or nonviolent videogame and responses to vignettes in which they were asked what would happen next in the scenario, what they would do, and so on. To assess long-term effects, they explored relationships between exposure, preexisting empathy and attitudes toward violence, and vignette responses. No significant effect of type of game played on short-term empathic responses was found. However, participants with greater long-term exposure to violent videogames displayed lower preexisting empathy and lower scores on empathy vignettes. Thus, long-term exposure to violent videogames appears to have desensitized child participants, at least in terms of their levels of empathy, whereas short-term effects of playing a violent videogame (versus playing a nonviolent one) did not, suggesting a coarsening over time in the violent videogame player not paralleled in a single session.

Finally, Scharrer (2008) turned the lens to news content by exploring the relationship between amount of exposure to television violence, local newspapers, and local

television news and responses to news stories chronicling violent events (dependent measure). By focusing on emotional responses to the dependent news stories, perception of violence in them, and perception of the events covered as commonplace, the relationship between trait empathy – a frequent desensitization indicator (though not here) – and desensitization was explored. Respondents who reported higher exposure to violent entertainment television, local newspapers, and local television news were less sensitive to the violent news stories. Other predicted desensitization effects provided less uniform results. Trait empathy, as operationalized in this study, interacted with some forms of media exposure to predict emotional responses to and perceptions of the dependent measure stories, leading Scharrer (2008) to conclude that trait empathy plays a role in identifying individuals most susceptible to desensitization.

Along with the physiological indicators discussed previously, examination of cognitive, affective, and attitudinal responses provides a complete picture of the study of desensitization, with time playing a significant role in the process. The common focus on relationships between desensitization and subsequent exposure to stimuli will most likely continue to shape future inquiry, as will connections to aggression.

Behavioral Outcomes

Research has long shown that exposure to media violence can increase the likelihood of aggressive behavior and decrease the likelihood of prosocial behavior. Given that this volume includes a chapter on prosocial behavior (see Mares, Chapter 30), we will only address the research pertaining to aggressive behavior. Aggressive behavior, especially in correlational research, has been assessed using a variety of measures including self-reported, peer-reported, parent-reported, and teacher-reported aggression. Likewise, experimental studies have measured aggression in several ways, including observing participants in free-play situations, measuring the duration of noxious blasts that participants deliver to “opponents,” and employing projective tests.

Lab experiments dating back to the 1960s (e.g., Bandura, Ross, & Ross, 1963) demonstrate that television and film violence can cause short-term behavioral effects in some children and adolescents. Reflecting on the body of research, Sparks and Sparks (2002) contend that experimental data is “so consistent in favor of the conclusion that exposure causes increased aggression that fewer experiments have been conducted in recent years” (p. 275). Yet, there are some noteworthy examples of contemporary research. For example, Scharrer’s (2005) study, which examined the moderating role of personality, found some evidence that violent television programs can elicit a stronger effect among males with a higher level of trait aggression than their less aggressive counterparts.

To address limitations typically associated with lab-based research (e.g., artificiality, questionable measurement techniques, and the inability to assess long-term effects), scholars have conducted notable field experiments, including Boyatzis, Matillo, and

Newbitt (1995), who found that exposure to *Mighty Morphin Power Rangers* led to a significant increase in children's physical and verbal aggression in the classroom. In addition, longitudinal studies (see Huesmann & Eron, 1986; Huesmann, Moise-Titus, Podolski, & Eron, 2003) provide convincing evidence that long-term exposure to television violence during childhood predicts aggression and, in some cases, criminal behavior, in adulthood. Despite the limitations of laboratory research, it is important to highlight the work of Anderson, Lindsay, and Bushman (1999), who found that the cumulative effect sizes of lab- and field-based studies are quite similar, thereby suggesting that laboratory research is externally valid.

Collectively, whereas the body of research on television and film violence is large and fairly consistent, the literature on violent videogames and their behavioral effects is smaller in size and occasionally yields some conflicting results. Gentile et al.'s (2004) survey of middle school students found that time spent with violent videogames was a significant predictor of both self-reported arguments with teachers and self-reported physical fights with peers. Likewise, Bartholow, Sestir, and Davis' (2005) survey of college-aged males found that exposure to violent videogames is significantly correlated with self-reports of aggressive behavior. However, Wiegman and van Schie's (1998) survey of Netherlands youth failed to show a relationship between overall exposure to videogames and peer-reported aggression.

In addition to surveys, experimental research has found that undergraduates who played violent videogames punished confederates by delivering stronger blasts of noxious noise than did participants who played a nonviolent videogame (Anderson et al., 2004; Bartholow & Anderson, 2002). More recently, in exploring the role of game attributes, Fischer, Kastenmuller, and Greitemeyer (2010) found that college subjects who played a violent videogame using a personalized character exhibited more aggressive behavior (measured by participants' willingness to dispense hot chili sauce to a subsequent participant) than those who played a violent videogame using a nonpersonalized character. Other research, such as Williams and Skoric's (2005) longitudinal study of an online violent videogame, failed to show an increase in behavioral aggression, whereas Anderson et al. (2008) found a significant, positive longitudinal relationship between playing violent videogames and aggressive behavior. Despite some inconsistencies in the research findings, it is important to note that three meta-analyses (Anderson, 2004; Anderson & Bushman, 2001; Sherry, 2001) have found that, in the aggregate, there is a positive and significant relationship between videogame violence exposure and subsequent aggressive behavior.

The possibility that becoming desensitized to violence leads the way toward aggressive or even violent behavior is a matter of strong social significance. If individuals who see a great deal of violence in the media consider violence to be nonarousing, normative, and no real cause for concern, might this disinhibit their own aggressive tendencies? For instance, research into the relationship between videogame violence exposure and aggression has explored the potential mediating role desensitization can play, leading some to speculate that physiological desensitization (e.g., reduced heart rate) or desensitization effects (i.e., empathy) could play a

mediating role between exposure and aggression (Carnagey et al., 2007). Based on subjects' physiological responses to pictures from the IAPS following game play, Staude-Muller et al. (2008) found that players in a high violence game-playing group were more sensitive to aggressive cues than subjects who played a low-violence version of the same first-person shooter, a difference "explained by the priming of aggressive knowledge structures . . . pre-activated by the aggressive content . . . and more easily accessible [by subjects in the high-violence group]" (p. 48). Bartholow et al. (2005) examined the role of empathy as a mediator of the effect of videogame violence exposure on aggression. In their primary analysis, empathy was not a significant mediator of aggression. Despite finding a significant mediating role between exposure and a specific aspect of laboratory aggression, Bartholow et al. (2005) concluded that empathy appears to play a weaker mediating role than hostility, for which the team also tested. While there is not yet convincing evidence supporting a mediating role for desensitization between exposure and aggression, researchers continue to study the connections between these two areas of effects to better understand their relationship to one another.

Violent Content in Context

Research, in particular the National Television Violence Study (NTVS, Smith et al., 1998; Wilson et al., 1997, 1998), has identified "high-risk" contextual features of mediated violence that facilitate or inhibit aggressive thoughts, attitudes, and/or behaviors. For example, drawing on social cognitive theory, research shows that rewarded violence or violence that goes unpunished increases the likelihood of learning aggression, whereas punished aggression diminishes the risk. Likewise, aggression committed by an attractive perpetrator has been shown to increase the likelihood of learning from mediated aggression, whereas violence committed by unattractive or unlikable characters reduces this risk. Along these same lines, the more a person identifies with perpetrators of media violence (especially those perceived as attractive or likable), the more likely he or she will learn from the character's actions. Studies have also found that justified violence (e.g., using violence to "save the day") enhances the likelihood of an aggressive outcome; unjustified violence decreases this likelihood. Finally, we know that the presence of weapons, especially conventional ones (e.g., guns, knives), violence that appears "realistic," and humorous violence can promote the learning of aggression.

Potter (2008) presents a provocative point about violent media and desensitization in *Media Literacy*:

The kind of violence that upsets people the most is precisely the type of violence that they need to be exposed to more. [...] It is] the violence that most people do not complain about – or even perceive – that is doing them the most harm. (pp. 307–308)

Based on his work analyzing television violence (Potter & Smith, 2000; Wilson, Smith, Potter et al., 2002), he contends that humorless, highly graphic violence offends people, leading them to call for its strict control or elimination from media content. Potter (2008) views this as an inappropriate action based on an appropriate response; that is, being offended by media violence is an indication of sensitization to it, which is a reasonable, if not healthy, response. If media outlets simply make violence more humorous or portray its consequences as less serious, it may placate the offended, but they (the media outlets) are only sanitizing the content, and essentially desensitizing the audience to it.

Consider the violence in the “R-rated” *Saving Private Ryan* (highly graphic and sensitizing) compared to the violence in most “PG-13-rated,” comic book-inspired films (less graphic and desensitizing). Where the violent depictions in the restricted (by MPAA rating) Spielberg film could sensitize viewers to the horrors of war and human suffering, those in unrestricted superhero franchise films could have the opposite effect, highlighting the violent exploits of a heroic character while trivializing the suffering of victims. Or think about the violence found on television, where “programs targeted to children . . . contain more violence overall and . . . it is far more likely to be sanitized and trivialized [than violence in nonchildren’s shows]” (Wilson et al., 2002, p. 29). When Leone and Barowski (2011) examined “ratings creep” (the notion that, over time, adult content escalates in films with the same rating), they found that violence in PG-13-rated films increased significantly since 1988. Of the over 2,000 violent sequences coded, from mild (1) to rough and persistent (5), the majority (nearly two-thirds) were mild; this is precisely the kind of desensitizing violence to which Wilson et al. (2002) and Potter (2008) refer. Leone and Barowski’s findings coincide with Carnagey et al.’s (2007) conclusion that “the modern entertainment media landscape could accurately be described as an effective systematic violence desensitization tool” (p. 495), and the violence found in PG-13 films would be a major structure in that landscape.

Who is Most Susceptible?

While all media consumers are potentially vulnerable to media violence, research has indicated that some people are more susceptible than others. Over the years, researchers have identified several factors (often referred to as “individual differences”) that heighten a person’s susceptibility to the effects of media violence. For example, critics concerned with media violence have positioned young children as a unique audience especially susceptible. This concern is indeed warranted, with Paik and Comstock’s (1994) meta-analysis finding an inverse relationship between the age of the viewer and the magnitude of the effect of television violence on aggression. In addition to age, gender is another individual difference variable of interest to researchers. Paik and Comstock’s analysis revealed that television violence tends

to have a stronger effect on males than females, in part because males often pay more attention to violence. However, in recent years, research suggests that females are increasingly susceptible to media violence; this is partly attributed to societal change, the increase in aggressive female media characters (Jansz & Martis, 2007), and the increase in females playing videogames (Entertainment Software Association, 2010). Clearly, more research is needed to shed greater light on gender and susceptibility to media violence.

In addition to age and gender, researchers have studied the role of personality traits – especially trait aggression – in the relationship between media violence exposure and aggressive outcomes (see Chapter 8). Slater, Henry, Swain, and Anderson's (2003) "downward spiral model" is especially relevant to this area of research. Their model suggests that youth with a high level of trait aggression seek out violent media content and that exposure to media violence predicts aggressive outcomes in youth, such that both relationships are mutually reinforcing. Indeed, some research has found that characteristically aggressive young people are more likely to be influenced in the short-term by viewing media violence than those without aggressive traits (Anderson & Dill, 2000, Study 1; Scharrer, 2005).

Playing videogames complicates the relationship between individuals' trait aggression and the effects of media violence in ways viewing it on television or film do not. The player's ability to modify game content is one of the key characteristics of "interactivity" distinguishing gaming from traditional media viewing. Further, players' individual differences variables (e.g., age, gender, personality traits, etc.) are likely to shape how they play and respond to the game. In short, since a player controls his or her character's actions, we must consider that there are certain types of people with preexisting personality traits, such as trait aggression, who may play violent videogames using a more aggressive playing style; furthermore, an aggressive in-game playing style may shape post-playing aggressive outcomes. Cicchirillo and Chory-Assad (2005) emphasize that very little research has taken into account the extent to which players' personality traits may moderate negative outcomes; they go on to issue a call for research whereby "researchers should consider capturing the game play of their participants (e.g., recording it on DVD or videotape) and comparing the actual content played or produced by the game players to their aggressive responses" (p. 447).

Paradise (2007) responded to this call by conducting an exploratory study to test whether trait aggressiveness shaped aggressive in-game playing choices, and consequently whether aggressive playing choices influenced players' short-term aggressive thoughts. As hypothesized, results indicated that participants who played a violent videogame (24: *The Game*) produced more aggressive thoughts than those who played a nonviolent game (*Tetris*); however, contrary to the hypothesis, trait aggression did not moderate this relationship.

Data obtained by measuring participants' in-game playing style of 24: *The Game* also revealed that individuals play violent videogames in vastly different ways, with players' in-game violent acts varying substantially (between 57 to 255 acts). Subsequent

analyses indicated that participants' trait aggressiveness did not influence their style of videogame play (more aggressive versus less aggressive). However, results showed that a more aggressive playing style predicted aggressive thoughts. It is important to note that, to our knowledge, only one other study (see Peng, Liu, & Mou, 2008) has examined the relationship between trait aggression and playing style, finding that those with high-trait aggression employed a more aggressive style of game play, even after controlling for prior gaming experience and gender. Given that Peng and colleagues' (2008) findings are contrary to those found in Paradise's (2007) experiment, more research is needed to examine this relationship.

Conclusion

The connections between exposure to media violence, aggression, and desensitization extend across various effects dimensions, from physiological and cognitive to affective and behavioral. And the evidence chronicling myriad effects of screen media violence on people, from young children and preadolescents to teens and adults, is supported by decades of research examining these phenomena. If one factor stands out as guiding the thinking about, research into, and future examination of these connections, it is time. As we gain insight into the importance of time, the complex relationship between these factors will be further explained.

What we do know is that the relationship between exposure to media violence, aggression, and desensitization is not necessarily linear. In the short-term, exposure can lead, initially, to increased responsiveness suggesting aggressive effects. However, at certain time thresholds, there is evidence of decreased responses, thus suggesting a desensitization effect. It seems clear that this pattern of increased responses that give way to decreased ones guides much of the research in the field, and will continue to do so in the future.

When considering these effects in the long-term, an even more complex relationship may emerge. Over time and multiple exposures to media violence, people become desensitized not only to the violent content itself but to a host of other stimuli. Just how long this desensitized condition lasts is still uncertain, as is its role in facilitating aggressive behavior, but scholars will continue to examine the relationship between these two areas of media effects. Likewise, future researchers must address the important contextual factors of violent content, especially with the increasing sophistication and vividness of videogames. How violence is portrayed (or perpetrated) on screen, and its influence on the people who are exposed to it most, must guide future research.

Ultimately, we return to central questions of media effects: Are people with trait aggression drawn to violent media, and, if so, does further consumption of it numb them to its effects, and by extension to the world and people around them? Subsequently, does it make those people more aggressive? The evidence suggests that

the answer to most of these questions is a qualified “yes.” Aggressive people consume a lot of violent media, and, over time, are less reactive to it both short- and long-term, which carries over into other areas of their lives. How far and for how long it carries over will shape these lines of inquiry in the future.

Sex on Television

A Review of Socialization Effects and the Role of Context and Individual Differences

Kirstie M. Farrar

ABSTRACT

Adolescents and emerging adults watch a great deal of television and research shows that they are exposed to a steady stream of messages about sex and sexuality, the vast majority of which do not contain important messages about safe and healthy sexual behavior. Research finds that young people learn information about sex from watching television and that their attitudes about sexual topics, including sexual health, can be influenced. Evidence is mounting that watching sex on television is linked to both initiation of and advancement in sexual behaviors. This chapter will review the evidence on sexual socialization effects with an emphasis on the role of the context of a sexual portrayal in the effects process. The importance of gender and race in the effects process will also be highlighted and potential positive effects of sexual content in the media will also be discussed.

Social Importance

Research has established that exposure to television portrayals can influence social behavior, both in children and adults. For example, numerous studies indicate that depictions of television violence can increase aggressive behavior among viewers (see Chapters 4, 10, and 18, this volume). Attention to the effects of sexual content in the

media on audience members is more recent and the growing body of empirical literature on this topic suggests that several different types of effects are likely to occur. Adolescence is a crucial time for sexual development and sexual identity exploration. Therefore, our focus here is mainly on adolescents between the ages of 12 and 18. However, some of the relevant research reviewed does include slightly older or younger samples.

This chapter will review the evidence linking the media to sexual socialization effects. The role of the context of a sexual portrayal in the effects process will be discussed. The importance of gender and race in the effects process will also be highlighted and potential positive effects of sexual content in the media will also be discussed.

The United States continues to have a much higher teenage pregnancy rate than other industrialized nations and over half of new cases of sexually transmitted infections in 2000 were among young people aged 15 to 24 (Weinstock, Berman, & Cates, 2004). These statistics are not surprising given that only two in three teens report using condoms every time they have sexual intercourse and only 30% report always using protection during oral sex (NBC News/People Magazine, 2005). Although sexual behavior is developmentally normative for adolescents, research has found that most sexually active teens express regret that they didn't wait longer to become sexually active (National Campaign to Prevent Teen Pregnancy, 2002). Additionally, research shows that the younger adolescents are when they initiate sexual intercourse, the more at risk they are for outcomes such as sexually transmitted infections (STIs) and unplanned teen pregnancies (Abma & Sonenstein, 2001). Clearly young people are not consistently practicing safe sex and, given the public health implications of this behavior, it is important to understand what factors play a role in the sexual socialization of young people.

Sexual Socialization

Many factors come into play in the sexual socialization of youth. Parents, friends, and school are all sources that may contribute to the sexual education of adolescents. However, it appears that young people may not actually get much information from these important sources of socialization. Many teens report that they don't talk with their parents about sex. A recent survey by the Kaiser Family Foundation found that 56% of sexually active teens reported never having talked with their parents about sex. More than half of all sexually active teens also reported never talking with healthcare providers about STIs or contraception and they also report that sexual education doesn't prepare them to talk about sex (KFF, 2002). It is increasingly evident that the mass media may also play an important role in this process as well. Why might we expect sexual socialization effects to occur from mass media exposure?

First, young people spend a good deal of time engaged in some form of media use. Recent work by Rideout, Foehr, and Roberts (2010) reports that children

between the ages of 8 and 18 watch approximately four and a half hours of television daily, spend an hour and a half on the computer and about 30 minutes with print media. Second, sexual messages are extremely prevalent in all forms of mass media. Several large-scale content analyses of television conducted over the last decade by Kunkel and colleagues have found that sexual content occurs in approximately 70% of shows on television (see Kunkel, Eyal, Finnerty, Biely, & Donnerstein, 2005). Talk about sex occurs in 68% of programs and 35% of programs include some form of sexual behavior with portrayals of sexual intercourse occurring in more than 1 out of 10 television programs. Kunkel et al. (2005) also analyzed the top 20 programs viewed by adolescents aged 12 to 17 in 2004 according to Nielsen data. They found that 70% of the shows heavily watched by teens feature some sexual content and these shows average just over six scenes per hour of sexual talk or behavior. Just about one out of every two programs watched by teens contained sexual behavior, and 8% of these shows include sexual intercourse. Unfortunately, messages about safe and healthy sexuality are rare in the television landscape. In fact, the Kunkel et al. (2005) study found that only 4% of scenes with sexual content had any mention of sexual risk or responsibility. Only 5% of scenes with sexual content in teens' favorite programming mention sexual health issues. Additional work by Pardun, L'Engle, and Brown (2005) found a similar pattern for other media that adolescents use. Sexual content was frequent in movies, music, magazines and Internet sites yet explicitly healthy messages about sexuality were rare. Clearly young people are being exposed to a great deal of sexual content in the media yet it is important to note that they are not seeing many messages about safe and healthy sexuality.

Also missing from much of the television young people watch are messages about homosexuality. Recent content analytic work by Fisher et al. (2007) found that portrayals or discussion of gays, lesbians, or bisexuals are infrequent and stand in stark contrast to the previously mentioned prevalence of heterosexual content found on television. They found that only 15% of shows in their sample of more than 2,700 programs featured at least one instance of talk about sex or sexual behavior related to gays, lesbians or bisexuals.

Given the frequency and accessibility of sexual messages, socialization effects regarding sexuality are likely. As mentioned, young people may have an information gap when it comes to learning about sexuality. It's not surprising that the media may fill this gap as one of the most readily available alternatives. Young people may also find the media an attractive source for sexual information because they can observe characters dealing with sexual situations and dilemmas about which they may have questions but be too embarrassed to ask. For gay and lesbian youth, however, there is an extreme lack of role models to help fill their information needs. Overall, however, media messages are designed to be as appealing and engaging as possible and can be a very forthright source of sexual information. In some cases, young people rank the media as their top source of information about sexuality (Kaiser Family Foundation & Children Now, 1997).

Brown, Childers, and Waszak (1990) suggest that young people use the information provided in the media to learn sexual and romantic scripts. They can learn how, and when, it is appropriate to ask someone for a date and what precautions, if any, people should take if they are going to have sexual intercourse. Television, through its themes, storylines, characterizations, and dialogue, provides insight into these common sexual scripts in our society (Kunkel et al., 2005; Roberts, 1980). Notably, this is an aspect of social behavior to which young people otherwise may have relatively limited exposure. We now turn to an explication of some theories that shed light on the media's role in the sexual socialization process. Social learning/cognitive theory and cultivation are two theoretical perspectives that can help illuminate the ways in which sexual content in the media may influence young people.

Theoretical Perspectives

According to social learning theory, modes of response are learned through direct or indirect observation of models, including those presented in the media (Bandura, 1971). Viewers can learn “appropriate” behaviors by observing which televised behaviors are rewarded and which are punished. Implicit in this theory is the assumption that human behavior is guided by a desire for rewards. Therefore, the theory predicts that people will be more likely to emulate the behavior of others when those models are rewarded for their behavior. Research also suggests that, at least in the realm of violence and aggression, modeling is nearly as likely when the behavior is unaccompanied by any consequences – either positive or negative – as when it is rewarded (Bandura, 1977). Brown and Steele (1995) argue that “the theory would predict that teens who spend more time watching television programming that includes graphic demonstrations of attractive characters who enjoy having sexual intercourse with each other and rarely suffer any negative consequences will be likely to imitate the behavior” (p. 22). This is the predominant pattern of sexuality that is portrayed in the media so modeling effects seem likely.

In later iterations of his theory, Bandura (1994) focuses on the interaction between cognitive processes and environmental influences. One important cognitive factor is perceived self-efficacy, or people's beliefs about their ability to successfully produce certain behaviors. Bandura (1994) has shown that perceived self-efficacy can influence the behaviors that we choose to enact. We are more likely to model sexual behaviors we see in the media if we believe we have the ability to enact those behaviors. Research has shown that safe-sex efficacy, for example, is an important predictor of adolescent sexual behavior (Dilorio et al., 2001; Taris & Semin, 1998). Given that the media can lead to the perception that “everyone” is having sex and that negative outcomes are rare, it seems likely that the media could enhance sexual self-efficacy and encourage the modeling of sexual behavior as it may seem “easy” and unlikely to result in negative outcomes.

Additionally, contextual cues found in the media presentation such as the salience, attractiveness, and functional value of the modeled behavior are important. These cues seem especially relevant to sexual behavior as many young people don't have that much experience in this area and are interested in learning more as they anticipate their entry into the world of adulthood and "adult" behaviors. In addition, audience members are more likely to attend to, and learn from, models they perceive to be attractive. Many of the characters shown engaging in sexual intercourse on television are young adults and teenagers (Kunkel et al., 2005). These are characters adolescents are likely to find attractive and perceive as similar to themselves and this could increase the likelihood that they will model the behavior that they see especially since it is salient and perceived to have high functional value for adolescents.

Cultivation theory (see Gerbner et al., 1994; Chapter 2, this volume) predicts that heavy television viewers will, over time, come to perceive the world as portrayed on television as an accurate depiction of reality. Television is a powerful storyteller in our culture and it continually repeats the myths and ideologies which legitimize our social order and define our world (Gerbner et al., 1994). If unmarried couples are frequently depicted as engaging in sexual intercourse, cultivation theory would predict that young people who watch a lot of television would come to see unmarried intercourse as a cultural norm. Collins et al. (2004) argue that the prevalence of and emphasis on sexual content on television could create the illusion that sex is more central to daily life than it typically is for most people. In turn, this cultivation effect could contribute to sexual initiation among young people who believe that "everyone is doing it." Indeed, Brown et al. (2006) found the perception that one's peers are having sex to be one of the strongest predictors of early initiation of sexual intercourse.

Cultivation theory has been well supported in several areas of television content, especially television violence. What types of "facts" about sexual behavior would emerging adults who watch heavy amounts of television be likely to internalize? Based on the findings of Kunkel et al. (2005) discussed above, several likely patterns emerge. First, sex is very common. Most characters on television talk about sex frequently as well as often engage in sexual behaviors. Most people who have sexual intercourse are not married to one another yet they usually don't take any precautions to prevent unwanted pregnancies or sexually-transmitted diseases. Despite this lack of precautionary measures, most characters rarely experience any negative outcomes from their sexual behavior. Heavy television viewers may come to believe that sex is a common and important topic of conversation; that everyone is having sex; and that responsible sexual behaviors are not important or are unnecessary as negative outcomes are unlikely. The findings of Tolman, Kim, Schooler, and Sorsoli (2007) also suggest that heavy viewers may see homosexuality as abnormal or exceptionally rare given its infrequent portrayal.

In summary, both social learning theory and cultivation suggest that media depictions of sexuality can have an effect on adolescents. They can learn scripts for sexual behavior as well as cultivate attitudes about appropriate sexual behavior and

social norms. They may also model the behaviors they see on the screen. Unfortunately, they are not likely to model safer sex behaviors as these are rarely emphasized in the media landscape. These theoretical perspectives suggest that effects are likely. However, in order to determine if televised depictions of sexuality actually do have an effect a review of the direct empirical research addressing this issue is in order.

Empirical Research

A growing body of literature, both correlational and experimental, on the effects of sexual content in the media suggests several types of likely sexual socialization outcomes. These include cognitive outcomes, effects on attitudes, effects on sexual expectations, attributions and perceptions of social norms and, more recently, evidence of behavioral outcomes.

A significant body of literature demonstrates that attitudes towards sex and sexuality can be impacted by media portrayals. Several studies have shown that exposure to certain types of portrayals can be linked to increased acceptance of stereotypical attitudes towards sex. For example, students exposed to sexual and sexist music videos later offered a stronger endorsement of stereotypical attitudes towards sex than did those students not exposed to such content (Greeson & Williams, 1986). Ward (2002) also found that young women exposed to prime time television images endorsing stereotypical sexual schemas such as the sexual objectification of women or dating as a game, later offered stronger support for these stereotypes than did young women not exposed. Greater exposure to sexually oriented genres such as soap operas has also been linked to more stereotypical attitudes towards sex in some instances but not in others (see Ward, 2003). In their experimental work, Bryant and Rockwell (1994) found that exposure to sexual scenes from prime time television led to an increase in the acceptance of sexual improprieties (e.g., extramarital affairs) among teenagers in their study.

Exposure to sexual content has also been linked to attitudes towards one's own sexual status and experience. For example, Courtright and Baran (1980) found evidence of a cultivation effect when they noted that frequent TV viewers were less satisfied with their own sexual experiences and had more negative attitudes toward remaining a virgin.

Finally, it appears that exposure to messages related to safe sex can impact young people's attitudes toward condom use. Farrar (2006) conducted an experiment using college students and found that women exposed to prime time dramas featuring sexual intercourse and mentions of condom use later had more positive attitudes about safe sex and condom use compared to women who saw intercourse with no mention of condoms or safe sex, or the control group. These effects did not emerge for men (an interesting trend which will be discussed later).

Television has also been shown to affect broader normative beliefs about sex (see Buerkel-Rothfuss & Strouse, 1993). In other words, sexual content in the media can influence our beliefs about what we think other people believe and how they behave.

Evidence for cultivation effects is strong and a consistent association between viewing amounts and viewers' perceptions of sex has been demonstrated in several studies (Ward, 2003). Media may function as a sort of "super peer" and contribute to the sense regarding sex that "everyone is doing it." In particular, studies have demonstrated that more frequent exposure to more sexually oriented genres such as soap operas or music videos is linked to one's assumptions about the prevalence of sex and certain types of sexual behaviors typically seen in those genres (e.g., Buerkel-Rothfuss & Strouse, 1993; Ward, 2002). For example, undergraduate students who were more frequent soap opera viewers tended to give higher estimates of the number of people who get divorced, engage in extra-marital affairs or have children out of wedlock compared to less frequent viewers of soap operas (Buerkel-Rothfuss & Mayes, 1981). Tolman et al. (2007) reported that, for girls, increased exposure to sexually objectified women and portrayals of men avoiding commitment led to decreases in perceptions of sexual agency. Fisher et al. (2009) found that teens that most often viewed sexually suggestive broadcast and cable shows were less likely to believe that sex would result in health problems. Martino, Collins, Kanouse, Elliott, and Berry (2005), in their longitudinal study of adolescents, also found that exposure to sex on television was significantly related to prosex norms and to fewer negative outcome expectancies. These findings make sense because, as mentioned above, negative health outcomes of sexual behavior are very seldom portrayed on television (Kunkel et al., 2005). The relative absence of homosexual portrayals on television may also cultivate negative attitudes. Gross (1984) found that television viewing was related to having stronger negative attitudes towards gays and lesbians and this effect emerged regardless of viewers' political beliefs.

As mentioned above, many young people report actively using the media to learn about sex. In fact, empirical evidence shows that learning does take place. Young people can learn information about topics related to sexual health from watching television. A survey by the Kaiser Family Foundation (1997) demonstrates clearly that young people can learn about sex and sexuality from television. More specifically, this research found that sexual health topics appearing in entertainment television shows can contribute to a substantial increase in viewers' awareness of important public health concerns. More recent research by Collins, Elliott, Berry, Kanouse, and Hunter (2003) found that adolescents who watched an episode of *Friends* that contained a subplot about condom efficacy and failure rates learned about condoms from watching the show. Both of these studies demonstrate that people can learn important information about sexual health from television and both will be discussed in more detail below in the section on "positive effects of sexual content."

In the experimental realm, Greenberg, Linsangan, and Soderman (1993) demonstrated that young people can learn from sexual content presented on television. Adolescents in the experimental group (ages 15 to 16) were exposed to several short

television clips (about 13 minutes) about topics such as prostitution, homosexuality, and married and unmarried sexual relations. All the clips were taken from situation comedies, prime time dramas, or soap operas. The results revealed that viewers were significantly more likely than non-viewers to have learned the meaning of several terms, such as “solicitation” and “freebie” when compared to teens in the control group that did not view the clips. These were terms that the teens did not uniformly know prior to exposure.

Effects of Media Portrayals on Sexual Behavior

Early studies on the effects of sex in the media on sexual behavior produced mixed results. Brown and Newcomer (1991) interviewed students at three different time periods (over four years) and found that having had intercourse by the third wave of data collection appeared to be related to seeking sexual content on television. In contrast, Peterson, Moore, and Furstenberg (1991) found that early exposure to television in general did not correlate with initiation of sexual intercourse a few years later. It is important to note that their measure of early television viewing was based on parental reports of their child’s viewing patterns. Also the television exposure variable measured television exposure generally and did not focus on types of content known to contain sexual talk and behavior. Therefore, the viewing measure may not have accurately captured exposure to sexual content on television. Some evidence does indicate that effects on behavior could be genre specific. Strouse and Buerkel-Rothfuss (1987) report that more soap opera viewing is linked to more sexual partners and more viewing of music videos is also linked to more partners but for women only.

More recently, three longitudinal studies have found evidence for a link between sex in the media and sexual behavior. Collins et al. (2004) examined 12- to 17-year-old subjects using surveys given one year apart. Television viewing was assessed at baseline and used to predict subsequent initiation of sexual activities the following year. The authors used Nielsen data to generate a list of programs frequently watched by teens in their target sample. Teens in the study then indicated the frequency with which they watched each of the listed programs. Three episodes of each of the programs were randomly sampled and content analytic techniques developed by Kunkel et al. (2005) were applied in order to determine both the amount and specific types of sexual content found in the shows. Participants subsequently received an exposure measure derived by multiplying their self-reported viewing frequency by an indicator of the average sexual content in an episode of each program. Overall, the authors reported that “a diet of TV high in sexual content at baseline was strongly related to initiation of intercourse and advancement of noncoital activities in the following year” (p. 284). This effect held even after controlling for more than a dozen other known predictors of sexual behavior. Watching the highest amount of sexual content effectively doubled the chances of initiating intercourse at the follow up. These effects were also remarkably consistent across all demographic groups.

Brown et al. (2006) took a similar longitudinal approach but they examined the effect of sexual content in television, movies, music, and magazines on the sexual behavior of Black and White adolescents aged 12 to 14 at baseline and 14- to 16-years-old at follow up. Respondents were initially presented with a list of offerings for each of the four types of media included in the study and asked to circle those they used regularly including specific television shows, movies, magazines, and music artists. Based on the results of this initial survey the media vehicles that were attended to by more than 10% of any demographic subgroup were analyzed for sexual content. For each participant a sexual media diet (SMD) score was then computed to be the overall proportion of sexual content in their media diet across those four media during a one month period at baseline.

For White adolescents a clear linear trend emerged such that White teens with higher SMD scores had sexual intercourse earlier than those with lower SMD scores. SMD also significantly predicted precoital sexual behavior at time two, even after controlling for precoital sexual behavior at baseline. The authors note that effect sizes for White adolescents were equivalent to what has been reported for the effects of violence on television and aggression. For Black adolescents the trend in the data was less clear. The effect sizes found were much smaller for Black adolescents and those with higher SMD scores were just about as likely to initiate intercourse as those with SMD scores in the middle. In a separate analysis of the time one data, Pardun et al. (2005) report, across all racial groups, that movies and music had a much stronger relationship with sexual behavior and sexual behavior intentions at time one than did exposure to sex in television and magazines. Clearly, it is important to examine more than just television when attempting to understand adolescent sexual socialization from media.

Martino et al. (2005) used structural equation modeling to look at the longitudinal relationship between exposure to sex on television and the initiation of intercourse among an ethnically diverse sample of 1,300 adolescents aged 12 to 17. They proposed a model where perceived sexual norms, self-efficacy, and outcome expectancies would mediate the relationship between exposure to television's sexual content and the initiation of sexual intercourse. Their model indicated a direct effect of exposure on intercourse initiation that was robust across gender and ethnic groups. However, they also found that, as predicted, the effect of television was fully mediated by the social cognitive variables of perceived sexual norms, self-efficacy, and outcome expectancies. After these processes are accounted for, the effect of television sex exposure on sexual behavior initiation is near zero. Across all racial groups, viewing sex on television was related to less negative outcome expectancies about the consequences of sexual intercourse, a finding that makes sense given that negative outcomes of sex are rarely portrayed on television. Less negative expectancies were in turn related to initiating sexual intercourse. Increased exposure also predicted higher estimates of the prevalence of sexual intercourse among one's friends and these perceived norms were also related to behavior changes.

A three-wave longitudinal study by Hennessy, Bleakley, Fishbein, and Jordan (2009) analyzed the relationship between adolescent (aged 14 to 16 at baseline) sexual behav-

ior and exposure to sexual media content over three years using growth curves. For this study, respondents' exposure to sexual media content was based on participants' own subjective rating of the amount of sexual content in each of the media titles (television, music, magazines, and videogames) they reported attending to. Their results also paint a complicated picture of the relationship between media exposure and sexual behavior. While they found changes in the amount of exposure to sexual content in the media to be predictive of changes in sexual behavior among White adolescents (similar to Brown et al.), they found little to no relationship among the Black adolescents in their sample. In fact, they found that both Black and Hispanic respondents actually evidenced a decline in the amount of sexual content they were exposing themselves to over the age range in the study. Therefore, it is possible that age 14 may be too late to capture a relationship between media exposure and behavior. The authors argue that it is possible that, by age 14, Black and Hispanic adolescents differ from White adolescents both in terms of their sexual behavior and their exposure to sexual content. This point is addressed in greater detail below in the section "Variables of Interest."

It is also possible, according to Bleakley, Hennessy, Fishbein, and Jordan (2008) that the relationship between sexual media exposure and sexual behavior is recursive. Their longitudinal study found evidence that sexually active adolescents are more likely to expose themselves to sexual content in the media. In turn, those exposed to sexual content in the media are more likely to progress in their sexual activity. Effects of sexual content in the media on sexual socialization may not be a straightforward linear process.

All of these recent longitudinal studies suggest a relationship between sex viewed in the media and sexual behaviors among at least some subgroups of adolescents. A complicated picture emerges, however. The results of Brown et al. reinforce the importance of examining more than just television and Martino et al. illustrate how the process of sexual media effects may not always be a direct one but rather one mediated through television's ability to influence young people's perceptions of social reality. It is also important to begin examining this relationship at younger ages as there is evidence that these effects may already be solidly entrenched by age 14 in some populations (Hennessy et al., 2009). Effects may also be recursive as sexually active adolescents expose themselves to more sex in the media and this increased exposure in turn leads to sexual behavior. Since the effects of sexual content in the media do not appear to be uniform across populations we turn now to a discussion of some of the important variables that may play a role in this process.

Variables of Interest

Age, gender, race, type of medium, and viewer involvement are some of the factors that can play an important role in how adolescents are affected by sexual content in the media.

Sexual content in the media is often implied or communicated via innuendo. Age or developmental level can play an important role in whether or not young people understand or are even aware of the sexual content they are exposed to. Younger children may not understand the sexual content they are being exposed to and adolescents who have not yet reached the start of puberty may not be as interested in sexual portrayals (Brown, Greenberg, & Buerkel-Rothfuss, 1993). As mentioned above, Hennessy et al. (2009) reported that Black and Hispanic respondents showed a decline in exposure to sexual content with an increase in age and they were also at a significantly higher level of sexual activity at an earlier age compared to Whites. It may be that Black and Hispanic youth are exposed to more sexual content at young ages or that they are affected by sexual content in the media earlier than White adolescents.

Race is a particularly important variable to consider when examining the effects of sexual content in the media. Some youth are more at risk from negative outcomes of sexual behavior than others. For example, young Black men and women have significantly higher rates of STIs than other ethnic groups in the United States (CDC, 2003). Interestingly, as mentioned above, findings for Black adolescents have not been as clear-cut as they have been for White adolescents. In the longitudinal studies examining sexual behavior, effect sizes were smaller for Black youth and trends between viewing sexual content and sexual initiation were not as clear (Brown et al., 2006) while Hennessy et al. (2009) found little to no association between changes in exposure to sexual content and changes in sexual behavior among Black youth. There are several possible reasons for these differences. Some research has suggested that African Americans watch more television and interpret the sexual content differently than other races (Brown & Schulze, 1990; Roberts, Foehr, Rideout, & Brodie, 1999). Given that Black youth evidence higher levels of sexual activity at younger ages than White youth (Hennessy et al., 2009) it could be that Black youth are forming their sexual attitudes and expectations at younger ages and have already begun acting on them before the age ranges during early to mid-adolescence when much of this type of research is conducted.

Gender is another important variable that often surfaces when discussing the relationship between sexual content in the media and effects. A frequent trend is to see effects of sexual content in the media on women but not on men (Ward, 2003). Ward (2003) argues that effects are "stronger, broader, and more consistent among women than among men" (p. 367).

For example, Farrar (2006) found that portrayals of safe sex on television impacted women's attitudes towards safe sex but not men's and Ward (2002) found that young women exposed to stereotypical portrayals of sexuality in prime time television later offered stronger support for these stereotypes while men's attitudes were not affected. However, it should be noted that the longitudinal studies discussed above did not see the same discrepancies in their findings between men and women. Many studies done on attitudes or sexual expectations have either focused on particular genres of programming or have used particular television programs as stimuli in experiments.

It has been suggested that men and women are attracted to very different types of media content (Greenberg et al., 1993). In addition, some suggest that men are less likely to use the media to learn about interpersonal relationships (Huston, Wartella, & Donnerstein, 1998). For men, the types of programs used in many of these studies may not be their preferred “instructors” (Ward & Rivadeneyra, 1999). Since the longitudinal studies reported above measure sexual content in the shows that men are actually watching, this may explain why findings hold true for both men and women in those studies.

While television has historically been the most researched medium regarding the effects of sexual content, some recent research suggests that it may not be the most important, at least to early adolescents. Pardun et al. (2005) found that for early adolescents it’s important to analyze their movie and music preferences. In their study, television and magazines had much weaker associations with sexual behavior variables. While adolescents still spend more time with television than they do with music or movies (Rideout et al., 2010) it is possible that they perceive the latter to be more important. Movies targeted specifically towards teens, for example, often feature extensive sexual content. It is possible that the nature of music and movies allows for more frank sexual content thus contributing more strongly to sexual socialization effects. The nature of the Internet may also make it a very prominent source of sexual socialization for young people especially given that they spend approximately 90 minutes per day using a computer and most of this time is spent online (Rideout et al., 2010).

Finally, how engaged viewers are with their media can also play an important role in the effects process. In their study, Ward and Rivadeneyra (1999) found that viewer involvement was an important factor for women. Specifically, for the women in the study, stronger identification with popular television characters and reporting using television to learn about the world predicted a greater acceptance of recreational attitudes towards sex.

Context of the Media Portrayal

In addition to variables specific to the viewer, there are variables specific to the mediated portrayal itself that can influence whether and/or what types of media effects take place. As mentioned above, social cognitive theory states that viewers are more likely to model mediated portrayals enacted by attractive characters that are rewarded for their behaviors, particularly when these behaviors are salient and perceived to have functional value. The large-scale content analyses of sex on television conducted by Kunkel et al. have consistently found that these are exactly the types of sexual portrayals young people are likely to encounter on television.

Another contextual feature that is particularly important in the realm of sexual content is whether or not the portrayal also includes any mention or depiction of

important sexual health topics or topics related to sexual risks or responsibilities. We know from Kunkel et al. (2005) that these types of portrayals are exceedingly rare on television and from Pardun et al. (2005) that they are rare in movies, music, Internet sites, and magazines viewed by young people. This is unfortunate given that several studies suggest that exposure to this type of content can have positive effects on adolescents. Farrar (2006) found that exposure to messages about condom use increased college-aged women's positive attitudes about safe sex. Collins et al. (2004) found that African Americans in their study with high levels of exposure to portrayals of sexual risks and responsibilities were less likely to have intercourse at the second wave of data collection. Conversely, the fact that sexual behavior as portrayed on television virtually never has any negative consequences can have a negative effect on viewers, as demonstrated by the finding that viewing sex on television has been associated with holding fewer negative outcome expectancies for the consequences of sexual intercourse. In turn, holding fewer negative expectancies was then related to the initiation of sexual intercourse (Martino et al., 2005).

Positive Effects of Sexual Content in the Media?

When most people think of media effects, they are thinking about negative or harmful effects. As shown above, sexual content in the media certainly contributes to some negative outcomes among adolescents such as early initiation of sexual behavior, unrealistic perceptions about the consequences of sex, or skewed perceptions about the prevalence of different types of sexual activities. However, is it also possible that the media can have positive effects on young people?

The media can serve as a catalyst for sexual conversations between parents and children. Parents can be an important source of accurate sexual information for young people; however, adolescents may be too embarrassed to come to their parents with questions about sex or sexuality. A national survey of 500 adolescents conducted by the Kaiser Family Foundation (2002) found that 33% of 15- to 17-year-olds said that something they saw on television spurred them to talk to their parents about sex.

In addition, Collins et al. (2003) conducted a survey of adolescents aged 12 to 17 who were regular viewers of the show *Friends*. They were asked questions about an episode that had recently aired in which condom failure rates and resulting unintended pregnancy are discussed as part of one of the show's subplots. Their results showed that 40% of the teens watched the show with an adult and 10% of the viewers subsequently had a conversation with an adult about condom efficacy. Youths who did talk with adults about condom efficacy were more likely to report learning something about condoms from the episode and less likely to report a decrease in their perceptions of condom efficacy than viewers who did not talk with an adult. So television may indeed serve as a catalyst and provide a safe introduction for teen-

agers to bring up sex with their parents and these conversations can help adolescents to learn accurate information.

As mentioned earlier, there may be an information gap for young people as they are learning about sex. They may not be getting much information from school or their parents. Learning is another effect of sexual content in the media that can be positive (assuming the information learned is accurate). Young people state that they learn about sex from the media. In the KFF (2002) study mentioned above, many adolescents claim to have learned something helpful from sex on television including how to say no to uncomfortable sexual situations (60%) and how to go about talking to sexual partners about safe sex (43%). Even though these types of sexually responsible situations are not that commonly portrayed on television, they are obviously capable of having a big impact on young people when they do occur. The Collins study referenced above indicates that television can serve as a source of safe-sex information. From 10% to 17% of viewers reported learning something new about condoms from watching the *Friends* episode and between 15% and 31% of viewers correctly recalled that condoms are between 95% and 100% effective when used correctly. Confirmed viewers (those who were able to correctly answer questions about the other subplots from the same episode) were more likely to have retained this information six months later. While the percentages of adolescents who learned from this episode may seem small, the authors themselves note that *Friends* was, at the time, one of the most popular shows for 12- to 17-year-olds and the episode was initially viewed by almost two million teens and has since been rerun countless times. The potential for learning is significant. Similar findings were reported for adults in a KFF (1997) study examining a portrayal of emergency contraception in the show *ER*. After viewing a relatively minor reference to emergency contraception within the show, the number of adult *ER* viewers who knew about emergency contraception increased 17% in the week after the episode aired.

The presence of information related to sexual risks or responsibilities of sexual behavior has been shown to have other positive effects on viewers as well. Farrar (2006) conducted an experiment manipulating the context of portrayals of sexual intercourse found in popular teen dramas. One group was exposed to three episodes of different programs where couples in the shows engaged in sexual intercourse and condoms were also mentioned or depicted somewhere within each episode. Another group saw programs where couples engaged in sexual intercourse but the episodes contained no references to condoms or safe sex. The control group watched teen dramas with no sexual content. Findings revealed that women who saw the shows with intercourse and safe sex had significantly more positive attitudes about condoms and safe sex than did the women in the other two groups. It should be noted that the references to condoms within these shows were relatively minor, only occurring in one or two scenes throughout the entire episode. Safe sex was hardly the focal point of these stories and yet, these scenes had a positive impact on young people's attitudes about responsible sexuality. The more frequently these portrayals are included, the more likely it is that young people

will come to see these important issues as part of the normative script for engaging in sexual behavior.

In addition to attitudes about safe sex, research also shows that the presence of messages about safe and healthy sexuality can impact adolescents' sexual behavior as well. Collins et al. (2004) found that African American adolescents who were exposed to the highest levels of sexual risk and safety portrayals were less likely to have intercourse and to progress in their noncoital sexual behaviors as well. This finding did not emerge for other races, however, and the authors suggest this as an important avenue for future research.

Conclusion

Many young people are engaging in unsafe sexual behavior, resulting in a high rate of STIs and unintended teen pregnancies. Teen pregnancies have profound effects on the young parents, the children, and on society. Teen moms are more likely to drop out of school and to live in poverty. Children born to teen moms are more likely to have a low birth weight, struggle with reading and math ability and even to drop out of high school themselves (Levine, Pollack, & Comfort, 2001; Terry-Human, Manlove, & Moore, 2005). While young people have a developmentally appropriate need to learn about sex and sexuality, many are not getting enough information from parents or from school thus creating an information gap. Research shows that adolescents engage in a good deal of media use and that this media is saturated with sexual content most of which does not contain important information about safe and healthy sexuality.

Young people say they use the media to learn about sex, and media portrayals are very attractive and salient for young people. Theories such as social cognitive theory and cultivation both suggest that effects from the media on the sexual socialization of young people are likely.

Empirical evidence in this area focuses on three main types of effects: attitudes, cognitions, and behavior. Research has shown that young people's attitudes toward sex and sexual topics can be influenced as can their perceptions about sexual norms. Young people can learn information about sex and about safe and responsible sexuality from the media. Finally, evidence from longitudinal work suggests that media diets high in sexual content can influence the initiation of sexual behavior and the advancement of other sexual behaviors. Sexual content in the media can have both positive and negative effects on young viewers, depending partly on the context within which it is portrayed. Variables such as the age, gender, and race of the viewer are also important in the effects process. Younger viewers may not be as interested in sexual content in the media or comprehend it as well. Some research also suggests that women are more affected by sexual content in the media and that different racial groups also respond differently. While the empirical evidence in this area has grown tremendously and consistently points to effects of sexual content in the media on young people, many avenues for future research remain.

Future Research

One important avenue for future research pertains to understanding how young people are interpreting sexual content in the media. What messages are they taking away? A better understanding of their interpretations might help us understand some of the differences in effects based on race that have been uncovered in some studies. It may also help us understand how younger kids are interacting with sexual content.

Research is also clearly needed on younger children, despite the inherent difficulties in conducting studies on such a sensitive topic with younger samples. It may be that effects from sexual content in the media are starting to emerge well before the ages typically studied (Hennessy et al., 2009). This may be particularly important to explore with Black and Hispanic youth who are exposed to more sexual content at younger ages and also tend to initiate sexual behavior earlier than White youth.

Research should continue to explore “edutainment” as a fruitful method of disseminating important messages about safe and healthy sexuality. If single episodes of shows like *Friends* and *ER* can impact people’s beliefs about safe sex, more frequent treatment of these topics across the media consumed by young people could prove beneficial. Research could also explore what factors make these types of portrayals so successful. If factors such as engagement with characters, identification, and so on, can be identified they can then be used to craft more long-term and extensive public health campaigns aimed at encouraging young people to engage in healthier sexuality.

As mentioned, most studies conducted up to this point have focused on television. Young people spend a great deal of time immersed with other media as well, however. Brown et al. (2006) found that exposure to sex in music and movies was a more important predictor of sexual behavior than exposure to television. As the media landscape continues to grow, we need to broaden our lens and continue to explore other media.

Finally, Ward (2002) also calls for more research on viewer involvement. Many of the variables related to involvement that have been shown to play an important role in other realms of media effects (e.g., violence) have been understudied when it comes to sex. Ward suggests heightened attention to variables such as identification, perceived realism, parasocial interaction and active viewing. A research focus only on the amount of content viewed may not tell the whole story.

Political TV Advertising and Debates

William L. Benoit and Jayne R. Henson

ABSTRACT

This essay begins by justifying the importance of two particular forms of political campaign communication, TV advertising spots and debates. Advertising spots and debates are two especially prominent forms of messaging in political campaigns and there is extensive research evidence regarding their role and the outcomes associated with each. Thus we sketch the nature of these key campaign message forms, focusing on the two dimensions of functions and topics. Then we discuss the historic controversy over minimal effects. This leads to a discussion of the effects of these important message forms, which is based on meta-analyses of these media.

Importance of TV Spots and Debates in Contemporary Society

For more than a century US political candidates have campaigned actively for the office of president. Indeed, in 2008 Barack Obama became the first candidate to decline federal financing for the general election campaign. He did so because accepting the federal funds meant he would be limited to spending \$84.1 million on his campaign (FEC, 2010). Declining federal financing meant he could spend as much as

The International Encyclopedia of Media Studies, First Edition.

he could raise; he spent \$760.1 million, \$427.6 million on media (Center for Responsive Politics, 2010). Others had declined to accept federal campaign funds for the presidential primary (e.g., George W. Bush and John Kerry in 2004; Hillary Clinton, John Edwards, and Mitt Romney in 2008; Lawrence & Schouten, 2007).

Initially, it was considered unseemly for a presidential candidate to campaign on his (all candidates were male at this point in time) own behalf. Of course, some would say presidential campaigns today remain unseemly. The first candidate to give a speech advocating his own candidacy was William Henry Harrison in 1840. In 1924, the major political nominating conventions were broadcast on radio. The first presidential primary debate, between two Republicans – Governor Thomas Dewey and Governor Harold Stassen – was broadcast on radio in 1948 (Kane, 1987). Harry Truman gave the first paid campaign speech, broadcast on television in 1948 (Jamieson, 1996). The 1952 election saw the first presidential TV spots aired in support of Republican Dwight Eisenhower and Republican Adlai Stevenson (Benoit, 1999) and ads ran in the primary as well as the general election campaigns. The first general election debate, of course, pitted Richard M. Nixon against John F. Kennedy in four one-hour debates in 1960; today millions of people watch the presidential (and, when they occur, the vice presidential) debates (Commission on Presidential Debates, 2010). Candidates employ a variety of means for reaching the electorate, including speeches, direct mail advertising, yard signs, campaign buttons, interviews, and, in recent years, candidate web pages, Facebook, and MySpace pages. Arguably, however, the two most important media in presidential campaigns are television spots and debates.

US Presidential Television Spots

Kaid declares that television advertising in political campaigns is the “dominant form” of communication between the candidate and the voter (2004, p. 157). During the 2004 primary campaign, for example, Democrats aired 16,683 and Republicans broadcast 12,042 political television advertisements, 95% of which were aired on local television stations (Czaja, Bausch, & Parrelli, 2007). With each successive year, candidates are spending more on campaign messages. In 2004, advertising media cost approximately \$1.17 billion dollars. Spending that included all marketing costs totaled approximately \$2.74 billion dollars, an increase of 126% from 2000 (Quinn & Kivijarv, 2005). In the first six months of the 2008 presidential primary season, candidates spent nearly \$200 million just on TV advertisements (TNS Media Intelligence, 2008). As indicated above, in 2008 Barack Obama spent more on his general election campaign overall, and his television advertising in particular, than any other presidential candidate in history. Clearly, candidates believe that political advertising is essential to their electoral success.

Scholars have produced considerable research investigating political TV spots; for example, books on this topic include: Ansolabehere and Iyengar (1995), Benoit (1999), Diamond and Bates (1992), Dover (2006), Geer (2006), Goldstein and Strach (2004),

Jamieson (1996), Johnson-Cartee and Copeland (1991, 1997), Kahn and Kenney (1999), Kaid and Johnston (2001), Kern (1989), Lau and Pomper (2004), Maisel and West (2004), Nelson and Boynton (1997), Nesbit (1988), Schultz (2004), Thurber, Nelson, and Dulio (2000), and West (2009). Research has investigated the functions and topics of presidential advertising (e.g., Benoit, 1999; or Kaid & Johnston, 2001). Patterns of issue ownership – the notion that each major political party is viewed by most voters as best able to deal with certain issues – (Petrocik, 1996) in presidential (Petrocik, Benoit, & Hansen, 2003/2004) advertising have also received scholarly attention. Some research has investigated presidential advertising in other countries besides the United States (see, e.g., Kaid, 1995; Lee & Benoit, 2004; or Wen, Benoit, & Yu, 2004). Loudan (2010a) has compiled a useful bibliography of work on political advertising.

Television advertisements have specific advantages for candidates and citizens. Candidates are able to spend considerable amounts of money on advertising (Benoit, 2007), which allows creation of multiple ads, which can be aired repeatedly. Candidates have the ability to choose when and where these advertisements are aired, and thus can reach a more carefully targeted segment of the electorate. Unlike news coverage of the candidates and their campaign messages, the media do not filter television spots (although the media may replay ads and comment on them after they are aired). Additionally, advertisements are entirely scripted, which allows candidates to control the entire message. The campaign comes to citizens in their own home (or wherever they watch television); they do not have to seek out information (in most cases) to learn about candidates in an election. This factor is particularly important for citizens who have little interest in politics and rarely seek out information about the candidates and the campaign. These messages are also short (most are 30–60 seconds, although Obama ran a 30-minute spot in 2008) and require very little effort on the part of the citizen to process.
